

SOUND WAVES

Sound wave travel as transfer of transmission of energy through a medium in the form of disturbance. It requires the disturbance/oscillation instead of the particles of the medium disturbance/oscillation/pressure/vibration/energy from one particle to adjacent.

The waves are of three types – mechanical, electromagnetic and matter waves. Mechanical waves require a medium and only in media which possess elasticity whether the media are solid, liquid or gas. Electromagnetic waves and matter waves are different categories of this type. Electromagnetic waves do not require any material medium for propagation. Radio waves, microwaves, infrared rays, visible light, the ultraviolet rays, X rays, gamma rays are electromagnetic waves. The waves exhibit different properties like reflection, refraction, diffraction, polarization, interference and other things.

Characteristics of sound waves:

- Pressure variation is a form of disturbance travelling in the medium along the parallel direction of the disturbance/oscillation/pressure variation.
- It is necessary that the medium should possess elasticity and inertia.
- Medium particles of the medium, move back and forth perpendicular to the direction of wave particle begins to vibrate in time later than the disturbance.
- The wave travels at different from the particle velocity. The velocity of a wave is constant for a given medium, whereas the velocity of the particles goes on changing and is sinusoidal/oscillatory in their mass particles motion in their vibrational position.
- During the propagation of wave density, change transfer of energy from one particle to other but without any transmission of the particles of the medium.
- The wave exhibits reflection, refraction, diffraction and interference.

Two kinds of sound waves:

- Longitudinal wave or transverse
- Transverse wave

Longitudinal wave:

Transverse wave travels in the form of transverse pulses. The disturbance/displacement of the particle in the medium is perpendicular to the direction of wave.

Transverse wave:

Transverse wave travels in the form of transverse pulses. The disturbance/displacement of the particle in the medium is perpendicular to the direction of wave. The wave travels at different from the particle velocity. The velocity of a wave is constant for a given medium, whereas the velocity of the particles goes on changing and is sinusoidal/oscillatory in their mass particles motion in their vibrational position.
