Natural Gas Monthly, 1994      *Complementarity Modeling in Energy Markets* Steven A. Gabriel, Antonio J. Conejo, J. David Fuller, Benjamin F. Hobbs, Carlos Ruiz, 2012-07-20  
This addition to the ISOR series introduces complementarity models in a straightforward and approachable manner and uses them to carry out an in-depth analysis of energy markets including formulation issues and solution techniques. In a nutshell, complementarity models generalize a optimization problems via their Karush Kuhn Tucker conditions to cooperative games in which each player may be solving a separate but related optimization problem with potentially overall system constraints, e.g., market clearing conditions, economic and engineering problems that aren't specifically derived from optimization problems, e.g., spatial price equilibria, problems in which both primal and dual variables (prices) appear in the original formulation, e.g., The National Energy Modeling System (NEMS) or its precursor PIES. As such, complementarity models are a very general and flexible modeling format. A natural question is why concentrate on energy markets for this complementarity approach? It turns out energy or other markets that have game theoretic aspects are best modeled by complementarity problems. The reason is that the traditional perfect competition approach no longer applies due to deregulation and restructuring of these markets, and thus the corresponding optimization problems may no longer hold. Also, in some instances it is important in the original model formulation to involve both primal variables, e.g., production, as well as dual variables, e.g., market prices for public and private sector energy planning. Traditional optimization problems can not directly handle this mixing of primal and dual variables, but complementarity models can and

this makes them all that more effective for decision makers

**Politics, Markets and EU Gas Supply Security** Sandu-Daniel Kopp, 2015-01-30 Sandu Daniel Kopp investigates whether carbon reduction targets are compatible with market driven competition in gas and power industries and whether security of supply is compatible with competitive markets He examines the policy trade offs which need to be made between the three different elements and whether these policy judgements should be economically or politically based The analysis shows the need for a complex set of politically determined options to protect competitive markets from price risks and emergency events and demonstrates that this has thus far failed the policy test Overall the author argues that the three major elements of EU energy policy are incompatible in important respects and thereby challenges much of the conventional wisdom of EU and Member State policies of the past decade
