Structure of Chromosome

A chromosome consists of:
1. DNA molecule
2. Proteins (histones)

Chromatin (DNA + Proteins)

What is DNA?

Deoxyribonucleic acid (DNA) is a molecule that carries the genetic instructions used in the growth, development, functioning and reproduction of all known living organisms and many viruses. DNA is a long molecule that is made up of two strands that are twisted around each other to form a double helix. The strands are made of a sugar-phosphate backbone and nitrogenous bases. The bases are the letters of the genetic code, and they pair up to form the rungs of the ladder. The sequence of bases determines the sequence of amino acids in a protein, which in turn determines the protein's function.

Where is DNA found?

DNA is found in the nucleus of eukaryotic cells, which is a membrane-bound organelle that contains the cell's genetic material. In prokaryotic cells, DNA is found in the cytoplasm, where it is not enclosed by a nuclear membrane. DNA is also found in mitochondria, which are organelles that have their own DNA. The DNA in mitochondria is inherited from the mother.

What is the Composition of DNA?

DNA is a polymer of nucleotides. Each nucleotide is made up of a deoxyribose sugar, a phosphate group, and a nitrogenous base. The deoxyribose sugar and phosphate group form the backbone of the DNA molecule, while the nitrogenous bases form the rungs of the ladder. The bases are divided into two categories: purines and pyrimidines. Purines are single-ring structures, while pyrimidines are double-ring structures. The bases pair up in a specific way: Adenine pairs with Thymine, and Guanine pairs with Cytosine. This base pairing is what allows DNA to replicate and pass on its genetic information.

What is a Gene?

A gene is a segment of DNA that contains the instructions for making a specific protein. Genes are the basic units of heredity and are passed from parents to offspring. The sequence of bases in a gene determines the sequence of amino acids in a protein, which in turn determines the protein's function. Genes are located on chromosomes, and the number and sequence of genes in a person's genome determine their genetic makeup.

What is a Chromosome?

A chromosome is a package of DNA and proteins that is visible during cell division. It is made up of a long DNA molecule that is tightly coiled around proteins called histones. The DNA molecule is the genetic material, and the proteins help to organize and protect it. Chromosomes are found in the nucleus of eukaryotic cells and in the cytoplasm of prokaryotic cells.

What is the Human Genome Project?

The Human Genome Project was an international research effort to determine the sequence of the human genome. It was completed in 2003 and has since provided a wealth of information about human genetics. The project has helped scientists to identify genes and understand how they work, which has led to advances in medicine and biology. The human genome is made up of approximately 3 billion base pairs, and the project has provided a complete map of this genetic code.
