Sensitive water : Dynamization & Information Milène Souvignet,2025-09-16 In traditional societies it is often believed that the Universe is one If we hold to this supposition each discipline suggests vision of the world based on its own concept and frame of reference Therefore overall everything is linked and closely interconnected It is in this frame of mind that water is approached from the little known and little documented angle of its sensitivity or dynamization The goal here is to summarise all the research carried out on this topic without making a catalogue out of it but rather trying to retrace the Ariadne s thread in order to link the different results and place each of them within a wider field of coherence and understanding Each of these advances is supported by the results and thoughts of numerous researchers each contributing a piece of the jigsaw according to his or her own speciality or approach physical chemistry biology quantum mechanics general relativity dynamics movement and so forth Nearly forty researchers from all over the world are involved from the 1900s to the present day including Jeanne Rousseau Goethe Theodor Schwenck Marc Henry Nassim Hamein Gerald Pollack and many others By analysing the work of each of them the author gradually offers here an increasingly accurate but also vast and coherent picture of the reality of water The starting point is based on what is known and commonly accepted by the scientific community Little by little the study progresses in a field that is increasingly confidential and or underdeveloped at present apart from in a few private or cutting edge research environments Three approaches are being explored the experimental way the observational way artistic way the theoretical mathematical way with the three major sciences of today Newton s classical mechanics macroscopic scale quantum mechanics infinitely small scale and Einstein s general relativity infinitely large scale

Energizing Water Jochen Schwuchow,John Wilkes,Iain Trousdell,2013-04-16 The poor quality of water as well as its restricted supply and availability is one of the biggest challenges of our time with presently two fifth s of the world s population unable to find adequate fresh

water for essential usage Over 40 years research has been carried out on the positive effects that rhythms and specific water flow has on water's capacity to support life Energizing Water presents this cutting edge research to the general and professional reader at a time when interest in finding solutions to water's huge worldwide problems is growing rapidly Three aspects determine water quality its chemical constituents including its oxygen levels its organic aspects with the danger of contamination by effluent pathogens and algae and its energetic nature The latter facet has been recognized from time immemorial by traditional societies who have developed their own sciences in relation to water quality using terms such as prana and chi for energy Now through the introduction of quantum physics into the life sciences modern science is beginning to accept this concept measuring energy as light emission Research into energetic water quality and particularly into the creation of moulded surfaces that support biological purification of the chemical and organic elements as well as enlivening the energetic attributes goes back to George Adams and John Wilkes pioneering work in the 1960s The invention of Flowform technology in 1970 carried this research further providing the world with one of the first modern day biomimicry eco technologies This creative technology applies nature's best methods to produce extraordinary results and this book outlines the background story on research and application of the Flowform method today JOHN WILKES originated the Flowform Method in 1970 following periods of work with George Adams and Theodor Schwenk After further research project work led to installations in many countries In 2002 an Institute was built at Emerson College providing more adequate space for research into the qualitative effects of rhythmic movement on water JOCHEN SCHWUCHOW is a freelance research and teaching consultant at Emerson College in England IAIN TROUSDELL is director of the Healing Water Institute in NZ

The Crisis of Innovation in Water and Wastewater Duncan A. Thomas, Roger R. Ford, 2005-01-01 This is an extremely well researched and documented book The authors hypothesis is that the current water and wastewater sector is failing the populations of the western world by clinging to orthodox and short term visions of new technology and innovation and also failing the developing nations by believing that delivery of western world high technology solutions is a contribution to humanitarian development This is the crisis of innovation To many practitioners in the water industry the book will be perceived to be hypercritical of the incrementalism conservative and dogged traditionalism of the sector but in fact it is stimulating and positive In the latter chapters an alternate more holistic model of water development is described There needs to be a movement from large central infrastructure resources to distributed systems that are more appropriate to local needs and can be coupled with environmentally sustainable energy sources and practices Tim Lack European Topic Centre on Water UK Whilst acknowledging a massive leap from standpipe to universal water provision in 100 years in developed countries the authors of this book see problems for global sustainable water supply and wastewater removal in the future Using the UK water industry as an example they describe the global water industry as risk averse and unwilling to innovate a view that is encouraged by the institutional and financial regimes under which it works The book explores the reasons for concern and sets out some hard hitting views on how the water industry is failing to identify and tackle the essential problems in a world which is becoming ever more depleted of fresh water The concluding chapter brings to a focus the problems of the crisis in innovation and gives some concrete suggestions for tackling them This volume should raise the awareness of policymakers and regulators technologists and concerned members of the public Peter Chave Independent Consultant and formerly Head of Pollution Control National Rivers Authority UK This significant new book highlights a little acknowledged but potentially catastrophic crisis of innovation in the global water sector which institutions and industries are frighteningly ill equipped to tackle or even accept It suggests potential new technology and policy approaches to overcome both current and future problems The book explores how technological innovation is vital to help provide sustainable water in both the UK and developing countries However innovation is being overlooked in the face of global trends to privatize and regulate water utilities The authors highlight how the global water sector is failing to respond to increasingly complex world needs and continues to build largely unsustainable centralized infrastructures opposing more appropriate distributed and local modern technologies The book also includes suggestions for potentially innovative technology and policy solutions to meet escalating global water and wastewater demands Importantly the authors adopt a long term perspective that crosses both disciplinary and institutional boundaries and include an international comparative perspective covering a diverse range of examples and countries This comprehensive book will have a broad appeal amongst researchers and academics with an interest in technology management innovation studies
