

Working stress design method (WSD)

- This design concept is based on elastic theory, assuming a straight line stress distribution along the depth of the concrete. Concrete response elastically upto compressive strength not exceeding about $\frac{1}{2}$ of its strength, while steel remains elastic practically upto yield strength. So, in practically, allowable stresses are set at about $\frac{1}{2}$ the concrete compressive strength and $\frac{1}{2}$ the yield stress of steel.
- The concrete remain elastic at $\frac{1}{2} \times f_c$ which range to strain of about 0.0005 and the steel is elastic near to it's yield point or strain of 0.002.
- According to ACI code the value is equal to $0.45 \times f_c$.

Assumptions:

- 1) Section remains plane
- 2) Stress proportioned to Strain
- 3) Concrete not take tension
- 4) No concrete-steel slip
