Topics in Extrinsic Geometry of Codimension-One Foliations Vladimir Rovenski, Paweł Walczak, 2011-07-26 Extrinsic geometry describes properties of foliations on Riemannian manifolds which can be expressed in terms of the second fundamental form of the leaves The authors of *Topics in Extrinsic Geometry of Codimension One Foliations* achieve a technical tour de force which will lead to important geometric results The Integral Formulae introduced in chapter 1 is a useful for problems such as prescribing higher mean curvatures of foliations minimizing volume and energy defined for vector or plane fields on manifolds and existence of foliations whose leaves enjoy given geometric properties The Integral Formulae stems from a Reeb formula for foliations on space forms which generalize the classical ones For a special auxiliary functions the formulae involve the Newton transformations of the Weingarten operator The central topic of this book is Extrinsic Geometric Flow EGF on foliated manifolds which may be a tool for prescribing extrinsic geometric properties of foliations To develop EGF one needs Variational Formulae revealed in chapter 2 which expresses a change in different extrinsic geometric quantities of a fixed foliation under leaf wise variation of the Riemannian Structure of the ambient manifold Chapter 3 defines a general notion of EGF and studies the evolution of Riemannian metrics along the trajectories of this flow e g describes the short time existence and uniqueness theory and estimate the maximal existence time Some special solutions called Extrinsic Geometric Solutions of EGF are presented and are of great interest since they provide Riemannian Structures with very particular geometry of the leaves This work is aimed at those who have an interest in the differential geometry of submanifolds and foliations of Riemannian manifolds *Topics in Extrinsic Geometry of Codimension-One Foliations* ,2011-08-07 **Extrinsic Geometry of Foliations** Vladimir Rovenski, Paweł Walczak, 2021-05-22 This book is devoted to geometric problems of foliation theory in particular those related to extrinsic geometry modern branch of Riemannian Geometry The concept of mixed curvature is central to the discussion and a version of the deep problem of the Ricci curvature for the case of mixed curvature of foliations is examined The book is divided into five chapters that deal with integral and variation formulas and curvature and dynamics of foliations Different approaches and methods local and global regular and singular in solving the problems are described using integral and variation formulas extrinsic geometric flows generalizations of the Ricci and scalar curvatures pseudo Riemannian and metric affine geometries and computable Finsler metrics The book presents the state of the art in geometric and analytical theory of foliations as a continuation of the authors life long work in extrinsic geometry It is designed for newcomers to the field as well as experienced geometers working in Riemannian geometry foliation theory differential topology and a wide range of researchers in differential equations and their applications It may also be a useful supplement to postgraduate level work and can inspire new interesting topics to explore

Geometry and its Applications Vladimir Rovenski, Paweł Walczak, 2014-05-05 This volume has been divided into two parts Geometry and Applications The geometry portion of the book relates primarily to geometric flows laminations integral

formulae geometry of vector fields on Lie groups and osculation the articles in the applications portion concern some particular problems of the theory of dynamical systems including mathematical problems of liquid flows and a study of cycles for non dynamical systems This Work is based on the second international workshop entitled Geometry and Symbolic Computations held on May 15 18 2013 at the University of Haifa and is dedicated to modeling using symbolic calculations in differential geometry and its applications in fields such as computer science tomography and mechanics It is intended to create a forum for students and researchers in pure and applied geometry to promote discussion of modern state of the art in geometric modeling using symbolic programs such as MapleTM and Mathematica as well as presentation of new results

of codimension one Gilbert Hector,1986 *On the Geometry of Some Special Projective Varieties* Francesco Russo,2016-02-01 Providing an introduction to both classical and modern techniques in projective algebraic geometry this monograph treats the geometrical properties of varieties embedded in projective spaces their secant and tangent lines the behavior of tangent linear spaces the algebro geometric and topological obstructions to their embedding into smaller projective spaces and the classification of extremal cases It also provides a solution of Hartshorne s Conjecture on Complete Intersections for the class of quadratic manifolds and new short proofs of previously known results using the modern tools of Mori Theory and of rationally connected manifolds The new approach to some of the problems considered can be resumed in the principle that instead of studying a special embedded manifold uniruled by lines one passes to analyze the original geometrical property on the manifold of lines passing through a general point and contained in the manifold Once this embedded manifold usually of lower codimension is classified one tries to reconstruct the original manifold following a principle appearing also in other areas of geometry such as projective differential geometry or complex geometry

Introduction to the Geometry of Foliations Gilbert Hector,Ulrich Hirsch,1983 Introduction to the Geometry of Foliations, Part A Gilbert Hector,Ulrich Hirsch,2013-03-09 Geometry Revealed Marcel Berger,2010-07-23 Both classical geometry and modern differential geometry have been active subjects of research throughout the 20th century and lie at the heart of many recent advances in mathematics and physics The underlying motivating concept for the present book is that it offers readers the elements of a modern geometric culture by means of a whole series of visually appealing unsolved or recently solved problems that require the creation of concepts and tools of varying abstraction Starting with such natural classical objects as lines planes circles spheres polygons polyhedra curves surfaces convex sets etc crucial ideas and above all abstract concepts needed for attaining the results are elucidated These are conceptual notions each built above the preceding and permitting an increase in abstraction represented metaphorically by Jacob s ladder with its rungs the ladder in the Old Testament that angels ascended and descended In all this the aim of the book is to demonstrate to readers the unceasingly renewed spirit of geometry and that even so called elementary geometry is very much alive and at the very heart of the work of numerous contemporary mathematicians It is also shown that there are innumerable paths yet to be explored and concepts to be created The book is visually rich and inviting so that readers may open it at random places and find much pleasure throughout according their own intuitions and inclinations Marcel Berger is t he author of numerous successful books on geometry this book once again is addressed to all students and teachers of mathematics with an affinity for geometry Extrinsic Geometry of Convex Surfaces Alekseï Vasil'evich Pogorelov,1973 Handbook of Geometry and Topology of Singularities V: Foliations Felipe Cano,José Luis Cisneros-Molina,Lê Dũng Tráng,José Seade,2024-06-06 This is the fifth volume of the Handbook of Geometry and Topology of Singularities a series which aims to provide an accessible account of the state of the art of the subject its frontiers and its interactions with other areas of research Singularities are

ubiquitous in mathematics and science in general and singularity theory is a crucible where different types of mathematical problems converge surprising connections are born and simple questions lead to ideas which resonate in other parts of the subject and in other subjects This Volume V focuses on singular holomorphic foliations which is a multidisciplinary field and a whole area of mathematics in itself Singular foliations arise for instance by considering The fibers of a smooth map between differentiable manifolds with singularities at the critical points The integral lines of a vector field or the action of a Lie group on a manifold The singularities are the orbits with special isotropy The kernel of appropriate 1 forms The singularities are the zeros of the form Open books which naturally appear in singularity theory as foliations with singular set the binding These important examples highlight the deep connections between foliations and singularity theory This volume like its companion Volume VI also focused on foliations consists of nine chapters authored by world experts which provide in depth and reader friendly introductions to some of the foundational aspects of the theory These introductions also give insights into important lines of further research The volume starts with a foreword by one of the current world leaders in the theory of complex foliations The book is addressed to graduate students and newcomers to the theory as well as to specialists who can use it as a guidebook
