Water Quality Modelling For Rivers And Streams Water Science And Technology Library:

Water Quality Modelling for Rivers and Streams Marcello Benedini, George Tsakiris, 2013-02-11 The main objective of the Water Framework Directive in the European countries is to achieve a good status of all the water bodies in the integrated management of river basins In order to assess the impact of improvement measures water quality models are necessary During the previous decades the progress in computer technology and computational methods has supported the development of advanced mathematical models for pollutant transport in rivers and streams This book is intended to provide the fundamental knowledge needed for a deeper understanding of these models and the development of new ones which will fulfil future quality requirements in water resources management This book focuses on the fundamentals of computational techniques required in water quality modelling Advection dispersion and concentrated sources or sinks of contaminants lead to the formulation of the fundamental differential equation of pollutant transport Its integration according to appropriate initial and boundary conditions and with the knowledge of the velocity field allows for pollutant behaviour to be assessed in the entire water body An analytical integration is convenient only in one dimensional approach with considerable simplification Integration in the numerical field is useful for taking into account particular aspects of water body and pollutants To ensure their reliability the models require accurate calibration and validation based on proper data taken from direct measurements In addition sensitivity and uncertainty analysis are also of utmost importance All the above items are discussed in detail in the 21 chapters of the book which is written in a didactic form for professionals and students

Water Quality Modelling Roger A. Falconer, 2020-01-29 Published in 1992 this book concentrates on recent developments applications and aspects relating to numerical hydraulic models for predicting flow and water quality parameters in coastal estuarine and river waters and river systems The various chapters cover a range of different types of models and discuss the role of such numerical models for environmental impact assessment studies The book is based on papers presented by leading experts in the field at a symposium held on 13 November 1991 organized by the Tyne and Humber Branch of the Institution of Water and Environmental Management It covers the latest developments in modelling techniques and approaches and also the concepts of water quality modelling as required and seen from the viewpoints of regulatory agencies such as the NRA consulting engineers and specialist modelling laboratories such as HR Wallingford and WRc As well as an up to date review it provides an understanding of the problems relating to water quality modelling and the scope and requirements for using water quality models in the water industry Readership includes practising engineers and scientists in the water industry including consulting engineers water companies and the NRA and other government departments university and polytechnic libraries staff and students and all other members of the water engineering profession

Environmental Systems Analysis with MATLAB® Stefano Marsili-Libelli, 2018-09-03 Explore the inner workings of environmental processes using a mathematical approach Environmental Systems Analysis with MATLAB combines

environmental science concepts and system theory with numerical techniques to provide a better understanding of how our environment works The book focuses on building mathematical models of environmental systems and using these models to analyze their behaviors Designed with the environmental professional in mind it offers a practical introduction to developing the skills required for managing environmental modeling and data handling The book follows a logical sequence from the basic steps of model building and data analysis to implementing these concepts into working computer codes and then on to assessing their results It describes data processing rarely considered in environmental analysis outlines the tools needed to successfully analyze data and develop models and moves on to real world problems The author illustrates in the first four chapters the methodological aspects of environmental systems analysis and in subsequent chapters applies them to specific environmental concerns The accompanying software bundle is freely downloadable from the book web site It follows the chapters sequence and provides a hands on experience allowing the reader to reproduce the figures in the text and experiment by varying the problem setting A basic MATLAB literacy is required to get the most out of the software Ideal for coursework and self study this offering Deals with the basic concepts of environmental modeling and identification both from the mechanistic and the data driven viewpoint Provides a unifying methodological approach to deal with specific aspects of environmental modeling population dynamics flow systems and environmental microbiology Assesses the similarities and the differences of microbial processes in natural and man made environments Analyzes several aquatic ecosystems case studies Presents an application of an extended Streeter Phelps S P model Describes an ecological method to estimate the bioavailable nutrients in natural waters Considers a lagoon ecosystem from several viewpoints including modeling and management and more
