Tinnitus Jos J. Eggermont, 2012-05-24 Tinnitus the perception of sound in the ear in the absence of external sound affects around 250 million people worldwide It occurs in adults as well as in children in war veterans and factory workers in classical musicians rockstars and disc jockeys Consequently a history of recreational occupational and firearm noise exposure may all be associated with an increased likelihood of acquiring tinnitus Being a subjective phenomenon tinnitus is difficult to measure though in the past decade it has become the subject of intensive scientific research Research in neuroscience has revealed how tinnitus is generated by the brain when hearing loss occurs and this research has played a part in helping us understand the cause diagnosis and treatment of this disorder The Neuroscience of Tinnitus reviews our current knowledge of the neural substrates of tinnitus It draws heavily on the author's own extensive work in this field and is divided into two parts the first focusing on human models the second on animal models The book describes the search for the

neural mechanisms that underlie the amplification process resulting in tinnitus and ways to manage its maladaptive side effects Based on over 1000 references and the author's own experience both of tinnitus and the research into its mechanisms this book is the most comprehensive single author book on the market It is a valuable reference source for auditory neuroscientists and also to those in the fields of audiology psychology neurology and otolaryngology *Hearing Science Fundamentals, Third Edition* Norman J. Lass, Jeremy J. Donai, 2025-06-02 *Hearing Science Fundamentals Third Edition* introduces the basic concepts in hearing science in an easy to understand format for undergraduate and graduate level students This textbook includes a wide variety of student friendly features designed to facilitate learning and instructor resources for seamless integration to the course The text is divided into four clear sections to cover everything from the physics of sound to the anatomy and physiology of the auditory pathway and beyond The textbook begins by delving into the basics of acoustics and digital signal processing DSP In the next section readers will find full coverage of the basic anatomy and physiology of the auditory mechanism The third section contains eight chapters on psychoacoustics and how sound is perceived via the auditory pathways The final section discusses pathologies of the auditory mechanisms Multiple disorders from each portion of the auditory system are described in detail These chapters are intended to provide an introduction to auditory pathologies to support future coursework in audiology and related fields New to the Third Edition Inclusion of additional Clinical Notes and computational examples in text Discussion topics provided at the end of each chapter to assist with student understanding of chapter material Additional topics included in multiple chapters such as information on auditory scene analysis navigating the auditory scene and the various decibal scales dB SL dB HL etc Links to helpful videos to enhance student understanding of topics from each chapter Key Features Learning Objectives and Key Terms at the beginning of each chapter prepare the student for the chapter contents More than 150 anatomical and line illustrations aid understanding of important technical concepts Q A boxes reinforce important information presented in the text Suggested readings at the end of each chapter for further clarification and study of the technical contents of each chapter A Glossary of important terms

Rodent Bioacoustics Micheal L. Dent, Richard R. Fay, Arthur N. Popper, 2018-08-28 By far the most widely used subjects in psychological and biological research today are rodents Although rats and mice comprise the largest group of animals used in research there are over 2 000 species and 27 families of rodents living all over the world except Antarctica and thriving in many different habitat types The vast environmental diversity that rodents face has led to numerous adaptations for communication including vocalizing and hearing in both the sonic and ultrasonic ranges effectively communicating in the open air and underground and using vocalizations for coordinating sexual behavior for mother pup interactions and for signaling an alarming situation to the group Some rodent species have even developed foot drumming behaviors for communication Comparative studies from around the globe using both field and laboratory methodologies reveal the vast differences in acoustic communication behavior across many rodent species Some rodents are amenable to

training and have been domesticated and bred purely for research purposes Since the early 1900s rats and mice have been indispensable to research programs around the world Thus much of what we know about hearing and vocalizations in rodents come from these two species tested in the laboratory The sequencing of the mouse genome in 2002 followed by the rat genome in 2004 only increased the utility of these animals as research subjects since genetically engineered strains mimicking human diseases and disorders could be developed more easily In the laboratory rats and mice are used as models for human communication and hearing disorders and are involved in studies on hearing loss and prevention hormones and auditory plasticity to name a few We know that certain strains of mice retain hearing better than others throughout their lifespan and about the genes involved in those differences We know about the effects of noise hormones sex aging and circadian rhythms on hearing in mice and other rodents We also know about normal hearing in many families of rodents including the perception of simple and complex stimuli and the anatomy and physiology of hearing and sound localization The importance of acoustic communication to these animals as well as the significance of these mammals to biomedical research are summarized in the chapters

Aging and Hearing Karen S. Helfer, Edward L. Bartlett, Arthur N. Popper, Richard R. Fay, 2020-10-20

Since the first edition of the *Aging Auditory System* volume in 2009 there has been a tremendous amount of research in basic translational and clinical sciences related to age related changes in auditory system structure and function The new research has been driven by technical and conceptual advances in auditory neuroscience at multiple levels ranging from cells to cognition The chapters in *Aging and Hearing: Causes and Consequences* span a broad range of topics and appeal to a relatively wide audience Our goal in this volume is to put together state of the art discussions about new developments in aging research that will appeal to a broad audience serving as an important update on the current state of research on the aging auditory system This update includes not only the recent research but also consideration of how human and animal studies or translational and basic research are working in tandem to advance the field This new edition is a natural complement to the previous SHAR volume on the aging auditory system edited by Gordon Salant Frisina Popper and Fay The target audience for this volume will be graduate students researchers and academic faculty from a range of disciplines psychology hearing science audiology physiology neuroscience engineering It also will appeal to clinical audiologists as well as to researchers working in the hearing device industry Individuals who attend conferences sponsored by the Association for Research in Otolaryngology Acoustical Society of America Auditory Cognitive Neuroscience Society American Auditory

How and Why Does Spatial-Hearing Ability Differ among Listeners? What Is the Role of Learning and Multisensory Interactions? Guillaume Andéol, Brian D. Simpson, Ewan A. Macpherson, 2016-08-29 Spatial hearing ability has been found to vary widely across listeners A survey of the existing auditory space perception literature suggests that three main types of factors may account for this variability physical factors e g acoustical characteristics related to sound localization cues perceptual factors e g sensory cognitive processing perceptual learning multisensory interactions and methodological factors e g differences in stimulus presentation methods across studies However the extent to which these and perhaps other still unidentified factors actually contribute to the observed variability in spatial hearing across individuals with normal hearing or within special populations e g hearing impaired listeners remains largely unknown Likewise the role of perceptual learning and multisensory interactions in the emergence of a multimodal but unified representation of auditory space is still an active topic of research A better characterization and understanding of the determinants of inter individual variability in spatial hearing and of its relationship with perceptual learning and multisensory interactions would have numerous benefits In particular it would enhance the design of rehabilitative devices and of human machine interfaces involving auditory or multimodal space perception such as virtual auditory multimodal displays in aeronautics or navigational aids for the visually impaired For this Research Topic we have considered manuscripts that present new methods or review existing methods for the study of inter individual differences present new data or review existing data concerning acoustical features relevant for explaining inter individual differences in sound localization performance present new or review existing psychophysical or neurophysiological findings concerning spatial hearing and or auditory perceptual learning and or multisensory interactions in humans normal or impaired young or older listeners or other species discuss the influence of inter individual differences on the design and use of assistive listening devices rehabilitation or human machine interfaces involving spatial hearing or multimodal perception of space ergonomics

Auditory Efferent System: New Insights from Cortex to Cochlea Paul H. Delano, Ana B. Elgoyhen, 2016-09-06 The main function of the sensory systems is the transducing of external stimuli into bioelectrical signals which are conducted through afferent pathways from sensory epithelia to the brain However it is known that descending projections are ubiquitous in the different sensory modalities and in the case of auditory efferents connect the cerebral cortex with sensory receptor cells Several functions have been attributed to the efferent system including protection to acoustic trauma unmasking of auditory stimuli in background noise balance of interaural sensitivity and some

cognitive functions like modulation of cochlear sensitivity during selective attention to auditory or visual stimuli In addition there is evidence of a possible involvement of the efferent system in the etiology or treatment of some clinical pathologies like tinnitus In this e book entitled Auditory Efferent System New Insights from Cortex to Cochlea we aimed to give an overview of the advances concerning the descending projections from the auditory cortex to subcortical nuclei and the olivocochlear system In addition different theoretical proposals of efferent functions are presented We think that this e book is an important contribution to the understanding of the efferent system in mammals merging auditory cortex literature with studies performed in the olivocochlear system
