Trees Of The Brain Roots Of The Mind:

Trees of the Brain, Roots of the Mind Giorgio A. Ascoli, 2015-04-24 An examination of the stunning beauty of the brain's cellular form with many color illustrations and a provocative claim about the mind-brain relationship. The human brain is often described as the most complex object in the universe. Tens of billions of nerve cells, tiny tree-like structures, make up a massive network with enormous computational power. In this book, Giorgio Ascoli reveals another aspect of the human brain: the stunning beauty of its cellular form. Doing so, he makes a provocative claim about the mind-brain relationship: If each nerve cell enlarged a thousandfold, looks like a tree, then a small region of the nervous system at the same magnified scale resembles a gigantic, fantastic forest. This structural majesty is illustrated throughout the book with extraordinary color images that hide the secrets behind the genesis of our mental states. Ascoli proposes that some of the most intriguing mysteries of the mind can be solved using the basic architectural principles of the brain. After an overview of the scientific and philosophical foundations of his argument, Ascoli links mental states with patterns of electrical activity in nerve cells, presents an emerging minority opinion of how the brain learns from experience, and unveils a radically new hypothesis of the mechanism determining what is learned, what isn't, and why. Finally, considering these notions in the context of the cosmic diversity within and among brains, Ascoli offers a new perspective on the roots of individuality and humanity.

Covert Plants Prudence Gibson, Baylee Brits, 2018 *Covert Plants* contributes to newly emerging discourses on the implications of vegetal life for the arts and culture. This stretches to changes in our perception of nature and to the adapting roles of botany, evolutionary ecology, and environmental aesthetics in the humanities. Its editors and contributors seek various expressions of vegetal life rather than

the mere representation of such and they proceed from the conviction that a rigorous approach to thinking with and through vegetal life must be interdisciplinary At a time when urgent calls for restorative care and reparative action have been sounded for the environment this essay volume presents a range of academic and creative perspectives from evolutionary biology to literary theory philosophy to poetry which respond to the perplexing problems and paradoxes of vegetal thinking Representations of vegetal life often include plant analogies and plant imagery These representations have at times obscured the diversity of plant behavior and experience Covert Plants probes the implications of vegetal life for thought and how new plant science is changing our perception of the vegetal around us and in us How can we think speak and write about plant life without falling into human nature dyads or without tumbling into reductive theoretical notions about the always complex relations between cognition and action identity and value subject and object A full view of this shifting perspective requires a stereoscopic lens through which to view plants but also simultaneously to alter our human centered viewpoint Plants are no longer the passive object of contemplation but are increasingly resembling subjects stakeholders or actors As such the plant now makes unprecedented demands upon the nature of contemplation itself Moreover the aesthetic political and legal implications of new knowledge regarding plants ability to communicate sense and learn require intensive cross disciplinary investigation By doing this we can intervene into current attitudes to climate change and sustainability and hopefully revise for the better human philosophies ethics and aesthetics that touch upon plant life

Language, Biology and Cognition Prakash Mondal, 2019-07-17 This book examines the relationship between human language and biology in order to determine whether the biological foundations of language can offer deep insights into the nature and form of language and linguistic cognition Challenging the assumption in biolinguistics and neurolinguistics that natural language and linguistic cognition can be reconciled with neurobiology the author argues that reducing representation to cognitive

systems and cognitive systems to neural populations is reductive leading to inferences about the cognitive basis of linguistic performance based on assuming false dependencies Instead he finds that biological implementations of cognitive rather than the biological structures themselves are the driver behind linguistic structures In particular this book argues that the biological roots of language are useful only for an understanding of the emergence of linguistic capacity as a whole but ultimately irrelevant to understanding the character of language Offering an antidote to the current thinking embracing biologism in linguistic sciences it will be of interest to readers in linguistics the cognitive and brain sciences and the points at which these disciplines converge with the computer sciences *The Mind and what Produces it* William Bonnar,1926
