Rushchitsky, 2014-04-23 The main goal of the book is a coherent treatment of the theory of propagation in materials of nonlinearly elastic waves of displacements which corresponds to one modern line of development of the nonlinear theory of elastic waves The book is divided on five basic parts the necessary information on waves and materials the necessary information on nonlinear theory of elasticity and elastic materials analysis of one dimensional nonlinear elastic waves of displacement longitudinal vertically and horizontally polarized transverse plane nonlinear elastic waves of displacement analysis of one dimensional nonlinear elastic waves of displacement cylindrical and torsional nonlinear elastic waves of displacement analysis of two dimensional nonlinear elastic waves of displacement Rayleigh and Love nonlinear elastic surface waves The book is addressed first of all to people working in solid mechanics from the students at an advanced undergraduate and graduate level to the scientists professionally interesting in waves But mechanics is understood in the broad sense when it includes mechanical and other engineering material science applied mathematics and physics and so forth The genesis of this book can be found in author's years of research and teaching while a head of department at SP Timoshenko Institute of Mechanics National Academy of Sciences of Ukraine a member of Center for Micro and Nanomechanics at Engineering School of University of Aberdeen Scotland and a professor at Physical Mathematical Faculty of National Technical University of Ukraine KPI The book comprises 11 chapters Each chapter is complemented by exercises which can be used for the next development of the theory of nonlinear waves *Theory of waves in materials*, *Wavelet and Wave Analysis as Applied to Materials with Micro Or Nanostructure* Carlo Cattani, I?A?rema I?A?roslavovich Rushchit's?ki?, 2007 This seminal book unites three different areas of modern science the micromechanics and nanomechanics of composite materials wavelet analysis as applied to physical problems and the propagation of a new type of solitary wave in composite materials nonlinear waves Each of the three areas is described in a simple and understandable form focusing on the many perspectives of the links among the three All of the techniques and procedures are described here in the clearest and most open form enabling the reader to quickly learn and use them when faced with the new and more advanced problems that are proposed in this book By combining these new scientific concepts into a unitary model and

enlightening readers on this pioneering field of research readers will hopefully be inspired to explore the more advanced aspects of this promising scientific direction The application of wavelet analysis to nanomaterials and waves in nanocomposites can be very appealing to both specialists working on theoretical developments in wavelets as well as specialists applying these methods and experiments in the mechanics of materials

Mathematical Methods for Physics using Microsoft EXCEL Shinil Cho,2025-06-10 In Mathematical Methods for Physics using Microsoft Excel readers will investigate topics from classical to quantum mechanics which are often omitted from the course work Some of these topics include rocket propulsion Rutherford scattering precession and nutation of a top under gravity parametric oscillation relativistic Doppler effect concepts of entropy kinematics of wave packets and boundary value problems and associated special functions as orthonormal bases Recent topics such as the Lagrange point of the James Webb Space Telescope a muon detector in relation to Cherenkov s radiation and information entropy and H function are also discussed and analyzed Additional interdisciplinary topics such as self avoiding random walks for polymer length and population dynamics are also described This book will allow readers to reproduce and replicate the data and experiments often found in physics textbooks with a stronger foundation of knowledge While investigating these subjects readers will follow a step by step introduction to computational algorithms for solving differential equations for which analytical solutions are often challenging to find For computational analysis features of Microsoft Excel including AutoFill Iterative Calculation and Visual Basic for Applications are useful to conduct hands on projects For the visualization of computed outcomes the Chart output feature can be readily used There are several first time attempts on various topics introduced in this book such as 3D like graphics using Euler s angle and the behavior of wave functions of harmonic oscillators and hydrogen atoms near the true eigenvalues

Bioinspired Materials and Metamaterials Edward Bormashenko,2024-08-14 Development of bioinspired materials and metamaterials has changed the philosophy of materials engineering and opened new technological possibilities as they demonstrate properties that are not found in naturally occurring materials This book examines advances in these emerging materials classes and investigates how their tailor engineered properties such as specific surface energy or refraction index enable the design of devices and ultimately the ability to solve complex societal problems that are in principle impossible with traditional materials The aim of this book is to survey the scientific foundations of the design and properties of bioinspired materials and metamaterials and the way they enter engineering applications Introduces the physico chemical foundations theoretical groundings and main equations of biomimetic and metamaterials science Describes how to develop and design these advanced materials and their applications Features end of chapter problems to help readers apply the principles Surveys achievements including metamaterials cloaking and the negative mass effect Emphasizes ecological aspects of materials science The text is intended for materials

engineering students who have completed courses in general physics chemistry and calculus as well as researchers in materials science and engineering

Biological-physical Interactions on Georges Bank Craig Van de Water Lewis, 1997

Advective losses of bank water during winter because of strong wind forcing were hypothesized to be a significant factor limiting recruitment of Georges Bank communities This hypothesis was examined using biological physical models of bank circulation with wind tidal and density driven circulation resembling winter conditions Models of stratification driven flow over an idealized bank addressed effects of storms on the spring plankton bloom An NPZ model and a copepod stage structure model were modeled as passive tracers Results indicate that strong storms 13 m s wind for 20 days can cause marked replacement of bank water and loss of zooplankton and phytoplankton These alterations in bank trophic structure may impair energy transfer from primary to secondary production and reduce recruitment of higher trophic levels Georges Bank Arctica islandica abundance data indicates that adults appear primarily below 50 meters with highest abundances on the South Flank Age and size structures suggest that a large cohort detected on the southeast flank in 1992 and 94 surveys was spawned in 1986 no other comparable recruitment was seen Larval transport was modeled using tidal forcing and winter wind data from 1974 1978 and 1991 This work revealed that modeled transport driven by vector averaged and realistic winds from the same periods differed Circulation using realistic winds was highly variable Ekman transport frequently overwhelmed tidal rectification and reversed the residual flow for several days Transport and matrix models of Arctica populations were compared with field data correlation of models with NMFS Survey data was best for realistic wind simulations from 1974 and 1991 Projection matrix eigenvalues were most sensitive to changes in adult and larval survival and planktonic duration Lower wind models identified the NE Peak region as having the highest reproductive value and sensitivity This work indicates that winter wind forcing is a factor determining transport of plankton Models suggest that interannual differences in Georges Bank transport depend partially on temporal wind variability They indicate that the Northeast Peak may be a source region for larvae and that Arctica research should focus on adult survival and planktonic mortality and duration
