Tribology And Mechanics Of Magnetic Storage Devices:

Tribology and Mechanics of Magnetic Storage Devices Bharat Bhushan, 2012-12-06 Magnetic recording is presently a 50 billion industry. It spans audio, video, and digital applications in the form of tapes and disks. The industry is expected to grow by a factor of five or more in the next decade. This growth will be accompanied by dramatic improvements in the technology, and the potential exists for magnetic recording densities to improve by at least one order of magnitude. Magnetic recording process is accomplished by relative motion between a magnetic head and a magnetic medium. Types of magnetic media for digital recording are flexible media tapes and floppy disks and rigid disks. Physical contact between head and medium occurs during starts and stops, and hydrodynamic air film develops at high speeds. Flying heights, mean separation between head and medium, are on the order of 0.1 micrometer, comparable to surface roughness of the mating members. Need for higher and higher recording densities requires that surfaces be as smooth as possible and flying heights be as low as possible. Smoother surfaces lead to increased static kinetic friction and wear. In the case of magnetic tapes, in order to have high bit capacity for a given size of a spool, we like to use as thin a tape substrate as possible. Thinner tapes are prone to local or bulk viscoelastic deformation during storage. This may lead to variations in head-tape separations, resulting in problems in data reliability.

Tribology of Magnetic Storage Systems Bharat Bhushan, 1998-03-13 Tribology of Magnetic Storage Systems is dedicated to the modern developments in the macro and microtribology and mechanics of magnetic storage systems. This collection of papers, previously published as Special Issues of the Proceedings of the Institution of Mechanical Engineers in the Journal of Engineering Tribology Part J, makes recent research in this important and rapidly developing area of engineering tribology accessible to industrial and academic researchers worldwide. The need for higher and higher recording densities in the modern magnetic recording process requires that surfaces be as smooth as possible and flying height be as small as possible in the interaction between magnetic medium and magnetic head. This presents significant challenges to researchers and designers within the industry. New techniques in atomic force microscopy and friction force microscopy have led to the development of the science of microtribology. Studies within this field are being conducted to enhance understanding of interfacial phenomena in magnetic storage devices. *Nanotribology and*
