ITE Trip Generation Manual

A manual developed by the Institute of Transportation Engineers (ITE), *Trip Generation*, 8th Edition, provides information for estimating the number of vehicle trips that may be generated by a specific building category, under a land use category. The information in this manual is provided based on approximately 4,800 trip generation studies submitted to ITE by: public agencies, consulting firms, universities and colleges, developers, associations, and local sections, districts and student chapters of ITE (Institute of Transportation Engineers 2008). The ITE Manual contains trip rates data for 162 land uses, under ten major land use categories for several time analysis periods (e.g., weekdays and weekends). These major land use categories are: Port and Terminal (Land Uses 000–099); Industrial/Agricultural (Land Uses 100–199); Residential (Land Uses 200–299); Lodging (Land Uses 300–399); Recreational (Land Uses 400–499); Institutional (Land Uses 500–599); Medical (Land Uses 600–699); Office (Land Uses 700–799); Retail (Land Uses 800–899), and Services (Land Uses 900–999). The land use classes directly related to freight activity are listed in Table 64b.

The land use classes in Table 64b are those that have explicitly calculated FTG rates, based on a percentage of total traffic. The classification type is a single code, and the geography is a single “site,” though it is unclear if the site is a tax parcel or a structure.

Establishment of Local Trip Generation Rates Or Equations for Mixed-use Developments in Kansas Mehrdad

Givechi, 2012 Currently the trip generation rates and equations contained in the Institute of Transportation Engineers ITE Trip Generation Manual 8th Edition are based on the information collected at single use free standing sites and cannot be directly applied to multi use developments Application of this data for multi use development sites requires use of an adjustment factor called internal capture rate which is expressed as a percent reduction to the trips generated by individual land uses These reductions are applied externally to the site at the entrances adjacent intersections and roadways They are distinct and separate from pass by and diverted link trips and are applied before pass by and diverted link trip reductions are applied While the trip generation rates for individual uses on a multi use development site may be the same or similar to what they are for free standing sites there is potential for interaction between among those uses within the site particularly where the trip can be made by walking As a result the total generation of vehicle trips entering and exiting the multi use site may be reduced from simply a sum of the individual discrete trips generated by each land use Because the development of mixed use or multi use sites is increasingly popular ITE wishes to increase the database on multi use developments in order to provide internal capture data for a broader range of land uses ITE would appreciate additional data from analyses of such developments The goal of this research project is to establish a local trip generation rate model for multi use developments in state of Kansas which can potentially be submitted to the ITE headquarter for inclusion in the national database as well The primary objectives were to identify several appropriate multi use development sites in the state and document vehicular trip data generated by each site in order to develop a trip generation model that can be used to better estimate trip numbers generated by such sites A total of three sites were selected and studied for this project including Mission Farms and Park Place developments both in Leawood Kansas and Metcalf95 Complex in Overland Park Kansas
