Game Equilibrium Models I Reinhard Selten, 2013-06-29 There are two main approaches towards the

phenotypic analysis of frequency dependent natural selection First there is the approach of evolutionary game theory which was introduced in 1973 by John Maynard Smith and George R Price In this theory the dynamical process of natural selection is not modeled explicitly Instead the selective forces acting within a population are represented by a fitness function which is then analysed according to the concept of an evolutionarily stable strategy or ESS Later on the static approach of evolutionary game theory has been complemented by a dynamic stability analysis of the replicator equations Introduced by Peter D Taylor and Leo B Jonker in 1978 these equations specify a class of dynamical systems which provide a simple dynamic description of a selection process Usually the investigation of the replicator dynamics centers around a stability analysis of their stationary solutions Although evolutionary stability and dynamic stability both intend to characterize the long term outcome of frequency dependent selection these concepts differ considerably in the philosophies on which they are based It is therefore not too surprising that they often lead to quite different evolutionary predictions see e g Weissing 1983 The present paper intends to illustrate the incongruities between the two approaches towards a phenotypic theory of natural selection A detailed game theoretical and dynamical analysis is given for a generic class of evolutionary normal form games

Learning and Teaching Mathematics using Simulations Dieter Röss, 2011-11-14 Mathematics course with 60 Java based interactive mathematic simulations by the author Comprehensive and systematically organized collection of 2 000 Java based physics simulations All simulations are runnable and can be accessed both on and offline Visualization of mathematic relationships Facilitates an experiment based understanding of problems including suggestions for your own mathematical experiments Calculation procedures can be adjusted in a variety of ways Introduction to simulation techniques with the EJS Easy Java Simulation tool Visual interface for simple and transparent modeling and programming Building block library for programming one's own simulations Quick access to simulations from links embedded in the digital text Mathematics is the language of physics and technology Yet in the age of computers mathematic skill is not based on mastery of arithmetic Rather it depends on understanding relationships in time and space and expressing them with precise and clear formulas In this regard one cannot rely on the rote memorization of rules and formulas insight and intuitive understanding are crucial But how can this understanding be achieved in higher mathematics which depends on abstract concepts such as complex numbers real and complex infinite series infinitesimal calculus 2 3 and 4 dimensional functions conformal maps vectors and linear and nonlinear ordinary and partial differential equations The author takes a highly practical approach to facilitating the insight essential for true learning in mathematics Students can work directly with the simulation programs can visualize relationships and creatively interact with the calculation procedures

Proceeding in textbook fashion the work makes use of a broad palette of multimedia tools and features numerous interactive calculation programs for mathematical experimentation Students merely have to select one of the many predefined examples and set the relevant parameters and in a flash the results are graphically displayed in 2 or 3 dimensions In addition the specific functions used can be changed or even newly formulated according to user preferences For example a procedure developed for a fourth degree power function for the numerical calculation of zero points can be adapted for use with another function Each simulation is accompanied by a detailed description instructions for use and numerous suggestions for experimentation The mathematical simulations are based on the Easy Java Simulation EJS programming tool All of the files developed with EJS are completely open and transparent The user can even draw on the examples as building blocks for the development his or her own calculation procedures The appendix contains a short introduction to EJS The work is enriched by a comprehensive collection of cosmological simulations as well as models from the Open Source Physics project organized by subject area Intended as a systematic collection of methods and materials for upper secondary school teachers and as a course for students of physics and mathematics the work facilitates hands on and experiment driven learning in higher mathematics The print version contains the electronic text and simulations for offline use For questions concerning download or online access to the simulations please contact service.degruyter.com
