Treatise on Basic Philosophy: Volume 6 Mario BUNGE,1983-08-31 **Treatise on Basic Philosophy** M.

Bunge,2012-12-06 In this Introduction we shall sketch the business of ontology or metaphysics and shall locate it on the map of learning This has to be done because there are many ways of construing the word ontology and because of the bad reputation metaphysics has suffered until recently a well deserved one in most cases 1 ONTOLOGICAL PROBLEMS

Ontological or metaphysical views are answers to ontological questions And ontological or metaphysical questions are questions with an extremely wide scope such as Is the world material or ideal or perhaps neutral Is there radical novelty and if so how does it come about Is there objective chance or just an appearance of such due to human ignorance How is the mental related to the physical Is a community anything but the set of its members and Are there laws of history Just as religion was born from helplessness ideology from conflict and technology from the need to master the environment so metaphysics just liketheoretical science was probably begotten by the awe and bewilderment at the boundless variety and apparent chaos of the phenomenal world i e the sum total of human experience Like the scientist the metaphysician looked and looks for unity in diversity for pattern in disorder for structure in the amorphous heap of phenomena and in some cases even for some sense direction or finality in reality as a whole *Mario Bunge: A Centenary Festschrift* Michael R.

Critical Debates on Quantitative Psychology and

Measurement: Revived and Novel Perspectives on Fundamental Problems Jana Uher, Jan Ketil Arnulf, Barbara Hanfstaengl, 2025-11-14 Psychology's continued crises in replicability, validity, generalisability, and thus confidence in its findings are currently attributed primarily to questionable research practices (QRPs) e.g. p-hacking, HARKing, cherry-picking. Popular pertinent debates therefore centre on proposals for remedying inappropriate method applications e.g. larger samples, robust statistics, pre-registration, replication. Replicable, non-random effects of psychological interventions and differentiations between individuals are essential for applied purposes. But current approaches to replicability, validity, and psychometric modelling are merely pragmatic, providing evidence of just utility to discriminate well and consistently between cases and in ways considered important e.g. social relevance, relations to future outcomes. Yet without understanding the study phenomena in themselves e.g. individuals experience, beliefs, thought processes, and without elaborating how relevant features of them can be made amenable to quantitative investigation, and if at all, the quantity objection, the actual causes of replicable quantitative findings cannot be explored. These causes, however, may be completely unrelated to the actual study phenomena e.g. methodomorphism. This concerns in particular the attributes and latent constructs studied in psychology, given that these are theoretical and statistical concepts that are attributed and construed as means of investigation and that only refer to but do not constitute the actual study phenomena in themselves. We believe the currently debated deficiencies of quantitative practices in psychology are just surface symptoms, whereas fundamental problems e.g. the inappropriateness of statistical assumptions for psychical phenomena and the actual root causes underlying psychology's crises and disputes around its scientific status are still hardly addressed. With this Research Topic, we want to give new impetus to critical debates on the epistemological and methodological foundations of quantitative methods and measurement in psychology, including problems long known but still hardly considered. Examples are: The behavioural and psychical phenomena's non-ergodicity rendering sample-level statistics uninformative about individual-level phenomena; Psychometricians' alignment of results to statistical theories rather than to features of the study phenomena, biasing inferences on the latter; Ideas that laypeople's intuitive judgements could reveal quantitative structures in complex, largely unobservable phenomena; The still unsupported claim that psychical phenomena could have quantitative properties at all and could thus be measured. The fact that psychometric structures shown for verbal item judgements can also be produced by semantic and Artificial Intelligence (AI) algorithms e.g. ChatGPT without collecting any empirical data. Still, most quantitative psychologists seem fairly unconcerned about the strong reliance on everyday language e.g. in ratings scales, and the imprecise concepts of psychological measurement, perhaps because their consequences do not become as straightforwardly apparent as in other disciplines such as in physics, chemistry, and medicine, where imprecise measurement can entail the collapse of buildings, chemical explosions, or drug overdoses. But where does the loose jargon around measurement variables and psychometrics go seriously wrong in psychology? These and

further contradictions problems and challenges underlying established quantitative practices in psychology must be addressed to tackle the discipline's continued crises and to develop new approaches that are needed to advance psychology as a science. We invite from all fields contributions that critically explore and open up new perspectives on the foundations of quantification and measurement in psychology including perspectives still hardly considered e.g. qualitative mathematics complex dynamic systems fuzzy systems modelling machine learning. We are also interested in methods for generating quantitative data either executed by persons e.g. time based observations computer based coding or by automated technology e.g. ecological momentary monitoring life logging reality mining. However other than commonly done we are explicitly not seeking proposals for improving specific techniques of data analysis e.g. statistical or latent variable models. Instead our focus is on making explicit and scrutinising the implicitly underlying rationales and fundamental principles thus the theory philosophy and methodology on which quantitative research in psychology currently is or should be built in the future. This also includes critical views on whether or not quantitative investigations are meaningful at all for a science exploring behaviour mind and society and thus also contributions to the psychology sociology and philosophy of science in this field.

Library of Congress. Copyright Office, 1976 *The SAGE Handbook of Research Methods in Political Science and International Relations* Luigi Curini, Robert Franzese, 2020-04-09 The SAGE Handbook of Research Methods in Political Science and International Relations offers a comprehensive overview of research processes in social science from the ideation and design of research projects through the construction of theoretical arguments to conceptualization measurement data collection and quantitative qualitative empirical analysis explicated through 65 major new contributions from leading international methodologists. Each chapter surveys builds upon and extends the modern state of the art in its area. Following through its six part organization undergraduate and graduate students researchers and practicing academics will be guided through the design methods and analysis of issues in Political Science and International Relations. Contributions cover a broad area of economics from criticism of institutional economics to examination of the role of induction in economic forecasting *Critique of Accounting* Richard Mattessich, 1995-09-14 The gap between the theory and practice of accounting is examined in this text by concentrating on the need for dealing with moral and other normative issues as well as the problem of relating means to ends. Accounting in both Great Britain and the United States is covered **Treatise on Basic Philosophy** Mario BUNGE, 1974-11-30 In this Introduction we shall sketch a

profile of our field of inquiry This is necessary because semantics is too often mistaken for lexicography and therefore dismissed as trivial while at other times it is disparaged for being concerned with reputedly shady characters such as meaning and allegedly defunct ones like truth Moreover our special concern the semantics of science is a newcomer at least as a systematic body and therefore in need of an introduction I GOAL Semantics is the field of inquiry centrally concerned with meaning and truth It can be empirical or nonempirical When brought to bear on concrete objects such as a community of speakers semantics seeks to answer problems concerning certain linguistic facts such as disclosing the interpretation code inherent in the language or explaining the speakers ability or inability to utter and understand new sentences of the language This kind of semantics will then be both theoretical and experimental it will be a branch of what used to be called behavioral science

The Laws of Scientific Change Hakob Barseghyan, 2015-08-17 This book systematically creates a general descriptive theory of scientific change that explains the mechanics of changes in both scientific theories and the methods of their assessment It was once believed that while scientific theories change through time their change itself is governed by a fixed method of science Nowadays we know that there is no such thing as an unchangeable method of science the criteria employed by scientists in theory evaluation also change through time But if that is so how and why do theories and methods change Are there any general laws that govern this process or is the choice of theories and methods completely arbitrary and random Contrary to the widespread opinion the book argues that scientific change is indeed a law governed process and that there can be a general descriptive theory of scientific change It does so by first presenting meta theoretical issues divided into chapters on the scope possibility and assessment of theory of scientific change It then builds a theory about the general laws that govern the process of scientific change and goes into detail about the axioms and theorems of the theory

Computing with Words in Information/Intelligent Systems 1 Lotfi A. Zadeh, 2013-03-09 These two volumes consisting of Foundations and Applications provide the current status of theoretical and empirical developments in computing with words In philosophy the twentieth century is said to be the century of language This is mainly due to Wittgenstein who said The meaning of a word is its use in the language game The concept game is a concept with blurred edges In the first phrase the language game implies the everyday human activity with language and in the latter game simply implies an ordinary word Thus Wittgenstein precisely stated that a word is fuzzy in real life Unfortunately this idea about a word was not accepted in the conventional science We had to wait for Zadeh's fuzzy sets theory Remembering Wittgenstein's statement we should consider on the one hand the concept of computing with words from a philosophical point of view It deeply relates to the everyday use of a word in which the meaning of a word is fuzzy in its nature

Epistemology & Methodology I: M. Bunge, 2012-12-06 In this Introduction we shall state the business of both descriptive and normative epistemology and shall locate them in the map of learning This must be done because epistemology has been pronounced dead and methodology nonexistent and because when acknowledged at all they are often misplaced

1 DESCRIPTIVE EPISTEMOLOGY The following problems are typical of classical epistemology

- i What can we know
- ii How do we know
- iii What if anything does the subject contribute to his knowledge
- iv What is truth
- v How can we recognize truth
- vi What is probable knowledge as opposed to certain knowledge
- vii Is there a priori knowledge and if so of what
- viii How are knowledge and action related
- ix How are knowledge and language related
- x What is the status of concepts and propositions

In some guise or other all of these problems are still with us To be sure if construed as a demand for an inventory of knowledge the first problem is not a philosophical one any more than the question What is there But it is a genuine philosophical problem if construed thus What kinds of object are knowable and which ones are not However it is doubtful that philosophy can offer a correct answer to this problem without the help of science and technology For example only these disciplines can tell us whether man can know not only phenomena appearances but also noumena things in themselves or self existing objects

Reframing the Social Professor Poe Yu-ze Wan, 2013-01-28 Drawing extensively on the research findings of natural and social sciences both in America and Europe Reframing the Social argues for a critical realist and systemist social ontology designed to shed light on current debates in social theory concerning the relationship of social ontology to practical social research and the nature of the social It explores the works of the systems theorist Mario Bunge in comparison with the approach of Niklas Luhmann and critical social systems theorists to challenge the commonly held view that the systems based approach is holistic in nature and necessarily downplays the role of human agency Theoretically sophisticated and investigating the work of a theorist whose work has until now received insufficient attention in Anglo American thought this book will be of interest to those working in the field of social theory as well as scholars concerned with philosophy of social science the project of analytical sociology and the nature of the relationship between the natural and social sciences
