Biofouling of Spiral Wound Membrane Systems Johannes Simon Vrouwenvellder, Joop Kruithof, Mark C. M. van Loosdrecht, 2011-03-15 The study of membrane biofouling has increased strongly in the past four years compared to the previous twenty two years indicated by the more than doubling of the number of scientific papers However no single source gives an updated overview of biofouling Biofouling of Spiral Wound Membrane Systems gives a complete and comprehensive overview of all aspects of biofouling bridging the gap between microbiology hydraulics and membrane technology High quality drinking water can be produced with membrane filtration processes like reverse osmosis RO and nanofiltration NF As the global demand for fresh clean water is increasing these membrane technologies are increasingly important One of the most serious problems in RO NF applications is biofouling excessive growth of biomass affecting the performance of the RO NF systems This can be due to the increase in pressure drop across membrane elements feed concentrate channel the decrease in membrane permeability or the increase in salt passage These phenomena result in the need to increase the feed pressure to maintain constant production and to clean the membrane elements chemically Biofouling of Spiral Wound Membrane Systems relates biomass accumulation in spiral wound RO and NF membrane elements with membrane performance and hydrodynamics and determines parameters influencing biofouling It focuses on the development of biomass in the feed concentrate feed spacer channel and its effect on pressure drop and flow distribution It can be used to develop an integral strategy to control biofouling in spiral wound membrane systems Most past and present methods to control biofouling have not been very successful An overview of several potential complementary approaches to solve biofouling is given and an integrated approach for biofouling control is proposed

Cameron,Katalin Hangos,2001-05-23 Process Modelling and Model Analysis describes the use of models in process engineering Process engineering is all about manufacturing of just about anything To manage processing and manufacturing systematically the engineer has to bring together many different techniques and analyses of the interaction between various aspects of the process For example process engineers would apply models to perform feasibility analyses of novel process designs assess environmental impact and detect potential hazards or accidents To manage complex systems and enable process design the behavior of systems is reduced to simple mathematical forms This book provides a systematic approach to the mathematical development of process models and explains how to analyze those models Additionally there is a comprehensive bibliography for further reading a question and answer section and an accompanying Web site developed by the authors with additional data and exercises Introduces a structured modeling methodology emphasizing the importance of the modeling goal and including key steps such as model verification calibration and validation Focuses on novel and advanced modeling techniques such as discrete hybrid hierarchical and empirical modeling Illustrates the notions tools and techniques of process modeling with examples and advances applications **Fatigue Life Analyses of Welded Structures** Tom Lassen,Naman Récho,2013-03-01 Avoiding or controlling fatigue damage is a major issue in the design and inspection of welded structures subjected to dynamic loading Life predictions are usually used for safe life analysis i e for verifying that it is very unlikely that fatigue damage will occur during the target service life of a structure Damage tolerance analysis is used for predicting the behavior of a fatigue crack and for planning of in service scheduled inspections It should be a high

probability that any cracks appearing are detected and repaired before they become critical In both safe life analysis and the damage tolerance analysis there may be large uncertainties involved that have to be treated in a logical and consistent manner by stochastic modeling This book focuses on fatigue life predictions and damage tolerance analysis of welded joints and is divided into three parts The first part outlines the common practice used for safe life and damage tolerance analysis with reference to rules and regulations The second part emphasises stochastic modeling and decision making under uncertainty while the final part is devoted to recent advances within fatigue research on welded joints Industrial examples that are included are mainly dealing with offshore steel structures Spreadsheets which accompany the book give the reader the possibility for hands on experience of fatigue life predictions crack growth analysis and inspection planning As such these different areas will be of use to engineers and researchers
