The Interstellar Age Jim Bell, 2015-02-24 The story of the

men and women who drove NASA's Voyager spacecraft mission the farthest flung emissaries of planet Earth told by a scientist who was there from the beginning Voyager 1 left our solar system in 2012 its sister craft Voyager 2 did so in 2018 The fantastic journey began in 1977 before the first episode of Cosmos aired The mission was planned as a grand tour beyond the moon beyond Mars Jupiter Saturn Uranus and Neptune and maybe even into interstellar space The fact that it actually happened makes this humanity's greatest space mission In The Interstellar Age award winning planetary scientist Jim Bell reveals what drove and continues to drive the members of this extraordinary team including Ed Stone Voyager's chief scientist and the one time head of NASA's Jet Propulsion Lab Charley Kohlhaas an orbital dynamics engineer who helped to design many of the critical slingshot maneuvers around planets that enabled the Voyagers to travel so far and the geologist whose Earth bound experience would prove of little help in interpreting the strange new landscapes revealed in the Voyagers astoundingly clear images of moons and planets Speeding through space at a mind bending eleven miles a second Voyager 1 and Voyager 2 are now beyond our solar system's planets the first man made objects to go interstellar By the time Voyager passes its first star in about 40 000 years the gold record on the spacecraft containing various music and images including Chuck Berry's Johnny B Goode will still be playable An ALA Notable Book of 2015 *Jesus Believes in Evolution* Eric Gray, 2008-12 *The World Book Encyclopedia* World Book, Inc, 2007 The World Book Encyclopedia was first published in 1917 as an 8 volume set The encyclopedia has been expanded many times through the years and now has 22 volumes This edition contains 2900 new or revised articles 200 new or revised maps 225 new photos 212 new tables and charts and 4890 pages are revised *Volcanoes* Rosaly M. C. Lopes, 2010-12 *Volcanoes* *The Solar System* David G. Fisher, Richard R. Erickson, 2010 Covers 180 features of Earth's solar system including every major body and phenomenon offering detailed basic information on all major aspects New Books on Women and Feminism, 2006 The British National Bibliography Arthur James Wells, 2004 **Special Papers**, 2010 American Book Publishing Record, 2003 **New Scientist and Science Journal**, 2004 **Choice**, 2006-03 *Volcanoes of the Solar System* Charles Frankel, 1996 Comprehensive and beautifully illustrated tour of recently discovered volcanic features of the Solar System **Fire and Ice** Natalie Starkey, 2021-09-30 A tour of the Solar System's tallest hottest coldest and weirdest volcanoes and a look inside what makes them erupt The volcano among the most familiar and perhaps the most terrifying of all geological phenomena However Earth isn't the only planet to harbour volcanoes In fact the Solar System and probably the entire Universe is littered with them Our own Moon which is now a dormant piece of rock had lava flowing across its surface billions of years ago while Mars can be credited with the largest volcano in the Solar System Olympus Mons which stands 25km high While Mars's volcanoes are long dead volcanic activity continues in almost every other corner of the Solar System in the most unexpected of locations We tend to think of Earth volcanoes as erupting hot molten lava and emitting huge billowing clouds of incandescent ash However it isn't necessarily the same across the rest of the Solar System For a start some volcanoes aren't even particularly hot Those

on Pluto for example erupt an icy slush of substances such as water methane nitrogen or ammonia that freeze to form ice mountains as hard as rock While others like the volcanoes on one of Jupiter's moons Io erupt the hottest lavas in the Solar System onto a surface covered in a frosty coating of sulphur Whether they are formed of fire or ice volcanoes are of huge importance for scientists trying to picture the inner workings of a planet or moon Volcanoes dredge up materials from the otherwise inaccessible depths and helpfully deliver them to the surface The way in which they erupt and the products they generate can even help scientists ponder bigger questions on the possibility of life elsewhere in the Solar System Fire and Ice is an exploration of the Solar System's volcanoes from the highest peaks of Mars to the intensely inhospitable surface of Venus and the red hot summits of Io to the coldest seemingly dormant icy carapaces of Enceladus and Europa an unusual look at how these cosmic features are made and whether such active planetary systems might host life
