Utilizing Technology to Increase Youth Engagement Towards Physical Activity Deborah Simone Fetter,2018 Engaging in regular activity during childhood contributes to better cardiorespiratory fitness and a greater likelihood of being active in adulthood Yet few youth in the United States meet the United States Department of Health and Human Services Physical Activity Guidelines for Americans recommendation of 60 minutes of moderate to vigorous activity MVPA per day Concomitantly the prevalence of childhood obesity remains alarmingly high in the United States with 31 8% of youth classified as overweight or obese There are a multitude of factors that contribute to the development of obesity including physical activity patterns Engaging in regular physical activity has been associated with a wide range of health benefits including improving body composition The school setting has been postulated to be a desirable place to promote physical activity because youth spend a large portion of their day in school and have the chance to expend up to half of their daily energy However the opportunities for youth to be physically active have been declining as physical education programs continue to be eliminated and recess time shortened in schools Additionally the availability of technology has increased in recent years and made engaging in sedentary behaviors such as playing video games and watching TV more accessible Yet there is potential in incorporating technology related to exercise into school based programs to generate interest in physical activity Further there are many determinants of physical activity to target for effective interventions including physiological psychological sociocultural and environmental factors Investigating how we can target these determinants in obesity prevention programs can lead to a greater understanding of how to encourage youth to develop lifelong physical activity habits The overall objective of this research was to investigate how utilizing technology in the school based multicomponent nutrition program the Shaping Healthy Choices Program SHCP

can help increase youth engagement towards physical activity The first objective of this research was to determine the impact of the SHCP on physical activity patterns in a sub sample of fourth grade youth Physical activity has been shown to have a wide range of beneficial health effects yet few youth meet the United States physical activity recommendation To address the increased prevalence of childhood obesity the SHCP was developed based on principles of the Social Cognitive Theory SCT and the Dietary Guidelines for Americans 2010 adaption of the Social Ecological Model The program was implemented over nine months among fourth grade youth One intervention school and one control school within the same Northern California school district were selected to participate in this sub study At pre and post intervention assessments youth wore a PolarActive monitor on their non dominant wrist 24 h d for at least 2 consecutive days Multiple linear regression was used to evaluate change in physical activity by adjusting for covariates and other potential confounders including ethnicity race household income and sex Statistical significance was set at p

Linking Parental Support and Parental Control to Physical Activity Participation in Youth Erin Katherine Wing, 2015 *Young People and Physical Activity*, 1999 Educating the Student Body, 2013 *The PULSE Program* Bryce Barker, 2014 The purpose of this doctoral thesis was to develop implement and evaluate the PULSE program a community based physical activity and life skills program for at risk youth The thesis is composed of four articles The first paper describes the rationale and development of the PULSE program which was designed to help youth develop the skills to self regulate and successfully perform physical activity The second article presents a process evaluation of the PULSE program This article examines how the youth progressed through the program with regards to the five levels of the Teaching and Social Responsibility TPSR model one of the frameworks on which the PULSE program is based A second purpose of this study was to understand the youths perceptions of the impact of the program on these five levels The results indicated that the program led to slight increases in the five levels of the TPSR model and the youth reported transferring the skills they learned related to the levels in their lives outside of the program The third paper represents an outcome evaluation of the PULSE program Results showed that youth who participated in PULSE increased their fitness physical activity levels as well as a number of positive youth development outcomes Finally the fourth paper examined how the PULSE program helps support the tenets of Basic Needs Theory The results indicated that the program successfully nurtured the three basic needs of autonomy competence and relatedness The overall findings suggest that the PULSE program is a practical evidence informed program that may help youth understand and apply life skills to be physically active as they approach adulthood and also more generally in their lives The current findings show promise for both Physical Activity PA and Positive Youth Development PYD outcomes but further research is needed to make causal links
