Belize ,2005 **The Ecology of Mangrove and Related Ecosystems** Victor Jaccarini,Els Martens,2013-03-09 The mangrove seagrass and coral reef ecosystems are of paramount ecological importance but have already undergone great degradation which is advancing at an alarming rate If present trends continue the natural resource basis of the economy and ecology of tropical coastal regions will soon be ruined This was the unanimous conclusion of the 110 scientists from 23 countries who gathered in Mombasa Kenya for a Symposium on the ecology of these ecosystems Mangrove forest systems yield large amounts of fish crabs prawns and oysters They are also valuable sources of fuelwood timber tannin and other natural products Their non marketable value is of equal importance stabilization of the coastline an indispensable nursery ground for numerous marine species with commercial value a natural filter maintaining the clarity of nearshore water a home for resident and migratory birds and other wildlife Many of the true mangrove flora and fauna are now endangered by the clearing of the mangroves It has been shown that in many countries between 25 and 100% of the mangrove forest has been destroyed already in the last twenty years The international scientific assembly concluded that much can be done to stop the degradation of these damaged ecosystems and to rehabilitate them But new techniques must be found to use them on a sustainable basis for long term economic return and for the well being of coastal human settlements and a healthy environment

Lynn Wingard,Chris Schneider,Gregory P. Dietl ,Damien Fordham, Policy makers and resource managers must make decisions that affect the resilience and sustainability of natural resources including biodiversity and ecosystem services However these decisions are often based on evidence or theory derived from highly altered systems and over short

time periods of low magnitude environmental and climatic change. Because natural systems change and evolve across multiple timescales from instantaneous to millennial long term understanding of how past life has responded to perturbations can inform resource managers. By using these natural laboratories of the past, conservation paleobiology and paleoecology provide the framework necessary to anticipate and plan for future changes. The goal of this Research Topic is to heighten awareness among conservation and restoration practitioners to the value and applications of long term perspectives provided by conservation paleobiology and paleoecology. Most conservation studies focus on systems already impacted by anthropogenic change; these studies would benefit from paleontological data through expanded temporal scales, identification of baselines, and an understanding of how organisms have responded to past changes. However, resource management decisions rarely include input from paleontologists, and paleoecological research is rarely incorporated into conservation decision making. We seek to bridge this research implementation gap by highlighting the application of paleoecological data to issues such as biodiversity, dynamics, extinction risks, and resilience to perturbations, among other topics. We hope to foster new cross disciplinary synergies by encouraging conservation scientists and managers to collaborate with paleontologists to improve conservation decision making and by increasing awareness among paleontologists to the needs of the resource management community. This Research Topic will provide a forum for both the paleontological and resource management communities to exchange ideas that will enhance restoration and conservation decision making. We invite papers on conceptual advances, reviews of specific topics to guide efforts in research or practice, case studies of successful applications, articles describing datasets with applied value and perspective, papers summarizing a body of paleontological research with relevance to the resource management community. Topics can include but are not limited to: Responses of species communities and ecosystems to perturbations; Strategies to achieve the direct integration of paleobiology and paleoecology into on ground resource management; Identifying baselines and reference conditions; Increasing the robustness of forecasting models through the incorporation of paleontological data; Identifying key species interactions and other phenomena as indicators of impending change; New methodologies, analytical tools, and/or proxies in the application of paleontological data to conservation and restoration practice.

Lynn Wingard, Damien Fordham, and Greg Dietl have no conflicts of interest. Chris Schneider has a potential conflict of interest where manuscripts pertain to stakeholders in the petroleum industry as she is an independent contractor in the Alberta Oil Sands mining area.
