OBJECTIVE:

The aim of this technical report is:

1. Introducing different types of internal combustion engines, based on different categorization.
2. Familiarization with the mechanism of operation of each, and the thermodynamic relations behind its theoretical cycles.

An Early Internal Combustion Engine

The above image is an early design for internal combustion four-stroke four-cylinder engine. The main idea for any engine is the existence of a combustion chamber, in which fuel-air mixture exists. Then, this mixture is allowed to burn; either using a spark or by increasing its temperature and pressure of the mixture. Due to combustion, energy is liberated and the piston is forced to move. Accordingly, it transforms the produced power to the gearbox using the crankshaft. It should also be noted that air is allowed to enter and mix with the fuel using the camshaft mechanism.
