

Finding the growth factor continued 2

Solve the equation for f

$$100 \cdot f^2 = 135$$

$$f^2 = 1.35$$

$$f = 1.162$$

The growth factor is 1.162 so our formula for the bacteria population, $p(n)$, after n hours is

$$p(n) = 100(1.162)^n$$

A Survey of Models for Tumor-Immune System Dynamics John A. Adam, Nicola Bellomo, 2012-10-06 Mathematical Modeling and Immunology An enormous amount of human effort and economic resources has been directed in this century to the fight against cancer The purpose of course has been to find strategies to overcome this hard challenging

and seemingly endless struggle We can readily imagine that even greater efforts will be required in the next century The hope is that ultimately humanity will be successful success will have been achieved when it is possible to activate and control the immune system in its competition against neoplastic cells Dealing with the above mentioned problem requires the fullest possible cooperation among scientists working in different fields biology immunology medicine physics and we believe mathematics Certainly biologists and immunologists will make the greatest contribution to the research However it is now increasingly recognized that mathematics and computer science may well be able to make major contributions to such problems We cannot expect mathematicians alone to solve fundamental problems in immunology and in particular cancer research but valuable support however modest can be provided by mathematicians to the research aspirations of biologists and immunologists working in this field
