Non-seismic and Non-conventional Exploration Methods for Oil and Gas in Cuba Manuel Enrique Pardo Echarte, Osvaldo Rodríguez Morán, Orelvis Delgado López, 2019-04-15 This book assesses the use of various non seismic and non conventional oil and gas exploration methods in Cuba In addition to discussing the benefits of these methods the book demonstrates how they can be combined with geological data and conventional methods leading to a better evaluation of prospects and exploration risks The authors describe how potential new gaso petroleum sites in the Pina Ceballos and Sancti Spiritus regions can be effectively mapped The geophysical geochemical exploration techniques combined in the Redox Complex method are used to identify and evaluate these sites Areas of interest are mapped based on the presence of a combination of indicator anomalies mainly derived using gravimetric aeromagnetic and airborne gamma spectrometry The geochemical study concentrates on two petroleum rich regions one in northern and one in southern Cuba The scope also includes the seas to the south of Cuba which are studied with non seismic exploration tools such as the Digital Elevation Model which employs morphotectonic regionalization *Offshore Exploration of Oil and Gas in Cuba using Digital Elevation Models (DEMs)* Manuel Enrique Pardo Echarte, Odalys Reyes Paredes, Valia Suárez Leyva, 2018-03-17 This book provides an overview of the major changes induced by hydrocarbons HCs affecting rocks and surface sediments and their implications for non seismic exploration methods particularly for marine territories near Cuba It examines the use of a digital elevation model DEM at 90x90m resolution for the detection of subtle positive geomorphic anomalies related to hydrocarbon microseepage vertical migration on possible oil and gas targets The results support the conclusion that the DEM data provides a low cost and fast offshore oil and gas preliminary exploration strategy This data is useful serving to focus prospective areas with supplementary unconventional methods such as magnetic induced polarization MIP useful to propose more expensive volumes for detailed 2D 3D seismic surveys

Geological-Structural Mapping and Favorable Sectors for Oil and Gas in Cuba Manuel Enrique Pardo Echarte, Osvaldo Rodríguez Morán, Lourdes Jiménez de la Fuente, Jessica Morales González, Orelvis Delgado López, 2022-02-07 The so called Non conventional geophysical geochemical exploration methods are used in the particular case of oil and gas exploration for the detection and mapping of active microseepage of light hydrocarbons with a vertical nature on the gas oil accumulations The non seismic exploration methods used in Cuba are Remote Sensing Gravimetry Aeromagnetometry Airborne Gamma Spectrometry AGS and Morphometry non conventional from the Digital Elevation Model 90x90m The AGS also classifies as a non conventional geophysical geochemical method together with the Redox Complex Besides it is of interest to know the geological structural framework where these microseepage occur That is why the benefits of using these methods excluding Redox Complex prior to their integration with geological and seismic data translate into a first approximation valid for an initial understanding of geology and mapping of favourable areas of possible gas oil interest Finally from the implementation of these methods including Redox Complex

perspective sectors for oil and gas are obtained once the integration with geology and seismic has been carried out. The book presents a brief theoretical account of the methods used and as practical results a set of perspective sectors of possible interest for exploration in Cuba. As a complementary result, the book also offers an evaluation of the areas that meet the petroleum geologist premises for the presence of large accumulations of high quality oil in Cuba.

Oil and Gas Exploration in Cuba Manuel Enrique Pardo Echarte, Jorge Luis Cobiella Reguera, 2017-04-24. A summary of the results achieved in the geological structural mapping by potential fields and airborne gamma spectrometry data of the units of igneous and metamorphic rocks in the western regions Havana Matanzas central Cienfuegos Villa Clara Sancti Spiritus and central eastern Camagüey Las Tunas Holguín of Cuba is presented. In addition, the structural tectonic regionalization with hydrocarbon exploration purposes focusing mapping of possible new oil gas targets in the regions of Land Blocks 9 23 and 17 18 are detailed in this volume. In certain case study locations Majaguillar North Motembo Guamutas and Maniabón reconnaissance work by a profile of Redox Complex complex of unconventional geophysical geochemical exploration techniques was performed with positive results. In an attempt to contribute to the geological structural mapping of the metamorphic massif Isla de la Juventud with emphasis on acid magmatism, the gravity magnetometric data is used. According to the results, the presumed post metamorphic granitic bodies of low density are located mainly in the central and southwestern part of the massif. The granitic bodies apparently were introduced through the system of longitudinal faults syn metamorphic and transverse post metamorphic at the end of the process. Multifolding and metamorphism of the massif sequences taking a leading role, the deep longitudinal fracture zones of sublatitudinal direction in the central and southern part of the massif. On the map of the magnetic field vertical derivative, the anomalies basically reflected the direction and limits of the folded tectonic structure, the development area of volcanogenic rocks, the presumed development zones of migmatitic rocks and tectonised rocks in North and center of the massif respectively and the prevailing direction of the main tectonic dislocations.

Unconventional Methods for Oil & Gas Exploration in Cuba Manuel E. Pardo Echarte, Osvaldo Rodríguez Morán, 2015-12-14. This book studies the Redox Complex, a complex of unconventional geophysical geochemical exploration techniques used for the indirect detection, characterization and evaluation of various metal targets, while also illustrating selected applications of unconventional geophysical geochemical methods for oil exploration in Cuba. This complex is successfully applied in various fields: oil studies of oil and metal contaminants in soils and the search for metallic archaeological burials. The use of these techniques is intended to complement the conventional prospecting complex by reducing areas and/or facilitating the selection of the most favorable targets, improving the economical geological effectiveness of investigations in the process. Further, the Redox Complex can be implemented without physical or chemical damage to the environment. The book's primary goals are to 1) outline the general features characterizing the processes of metal mobilization, transport and accumulation on surficial media, 2) outline the methodology, data interpretation and

mathematical apparatus that support quantitative estimates of the Redox Complex and 3 design a database and applications system the Redox System to address storage processes reports graphics and the corresponding interpretations of the Redox Complex in a quick and reliable way To do so it examines the regions of Havana Matanzas Varadero Oil Field Cantel Oil Field and Madruga Prospect and Ciego de vila Pina Oil Field Cristales Oil Field Jatibonico Oil Field Jatibonico Oeste Prospect and Cacahual Prospect The methods covered include in some cases airborne gamma spectrometry K eTh ratio beside ORP and in others the Redox Complex with reduced or standard attributes In all cases the anomalous complex of interest corresponds to the correlation of the minimum K eTh ratio with minimum ORP and in the case of the Redox Complex Magnetic Susceptibility highs with ORP lows Spectral Reflectance lows and maximum Content of Chemical Elements V Ni Pb Zn Fe
