Cells

What does it mean to be alive? To start with, all living things are made up of at least one cell. A cell is an area that is surrounded by a membrane where chemical reactions occur to keep the organism alive. There are a total of eight characteristics that indicate if something is living.

First, organization means that the basic unit of an organism is a cell. Whether these are simple or complex, growing with others or alone, they are needed to create an organism. If it is there, it is living.

Next, reproduction means that cells must be able to create other cells, whether they are the same as the original cell or share a mix of DNA from another cell. If cells are not able to reproduce, they will stop creating new cells, which means they will stop living.

Another characteristic is metabolism, the breakdown or building up of nutrients to use for actions like movement and growth. Cells must have energy to do tasks needed to survive. This comes from breaking down food into the smaller pieces needed to build energy molecules.

The trait of homeostasis means keeping the inside environment of the cell balanced. When cells gain too much of one substance, they must find a way to get rid of it in order to make room for nutrients that are lacking.

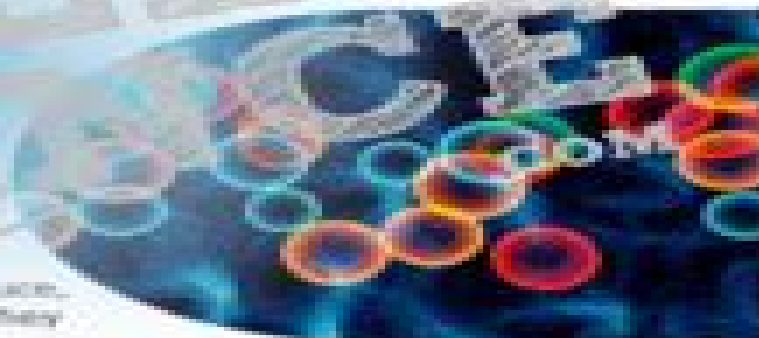

Heredity means passing genetic information on to the next generation. Heredity is found in the form of genes or DNA strands. When a cell divides, the daughter cell, or the one that is produced, is a combination of two parent cells sharing the same genetic code of DNA from multiple parent.

The characteristic of response or stimulus means that cells are able to detect or respond to something happening and can find a response for the stimulus. This might be an external stimulus like a change in the level of a gas or an internal stimulus like dehydration.

Growth and development means that the organism grows in size. It also means cells can become specialized for one task and that cells can group together in order to form complex organisms.

The trait of evolution is when organisms adapt to their environment over time in order to survive and reproduce. These adaptations allow cells to be more successful than the cells that came before.

If an object has these eight characteristics, they are considered living organisms made up of at least one cell.
