In TIG welding of stainless steel, welding rods having the AWS prefixes of E or ER can be used as filler rods. However, only bare uncoated rods should be used. Stainless steel can be welded using AC high-frequency stabilized current, however for Direct Current Electrode Negative (DCEN) current recommendations must be increased 25%. Light gauge metal less than 1/16 in. thick should always be welded with Direct Current Electrode Negative (DCEN) using Argon gas. Follow the normal precautions for welding stainless such as clean surfaces and dry electrodes. Use only stainless steel tools and brushes. Carefully remove soap from welds after pressure testing, and keep stainless from coming into contact with other metals.

- Notes:
- ◊ Reduce current 10 to 20% for vertical and overhead welds.
 - ▲ Ceramic cup should be used for currents up to 250 amps.
 - Water-cooled cup should be used for currents above 250 amps.
 - Welding speed for multiple passes cannot be accurately predicted.
