Weiterentwicklung Elektrochemischen Biosensors Pflanzenviren Insektiziden:

Chemical ecology of Cabbage White (Pieris sp.) (Band 49) Maliha Gul Aftab, 2021-10-06 Under the widespread concept of integrated pest management use of semiochemicals have been extensively studied to control agricultural pest insects In this regard aphrodisiac pheromones of two most destructive pest species of Pieris have been investigated Individual pheromone constituents produced in the wings of two Asian populations were compared with two European populations of P rapae The total pheromone levels in the European populations were lower than the amounts present in wings of Asian populations As a result of this study we can conclude that both the subspecies of P rapae showed a clear variation in pheromone profile between them On the other hand within subspecies the different populations did not show very large differences Therefore the populations with geographical difference could not be considered identical as they showed significant quantitative differences in pheromone profiles Furthermore Electroantennographic analysis was also carried out to find out specific pheromone lures which could be used for both the subspecies to carried out field bioassays in future to test the mating disruption strategy *Identification of variation within sex pheromone blends of various Maruca vitrata populations for refining pheromone lures and traps in Asia* Stefanie Schläger, 2017-07-12 The legume pod borer Maruca vitrata causes severe damage on legume crops in the tropics The larvae are mainly controlled by synthetic insecticides but without satisfying results Monitoring of the moths using pheromone traps can help to perform target oriented control measures The objective of this study was the improvement of pheromone traps for monitoring M vitrata in tropical Asia where synthetic pheromone lures failed to attract males so far In addition the sexual communication system of different M vitrata populations was investigated since variation in pheromone composition is a potential reason for failure of pheromone lures

Nikolelis, Georgia-Paraskevi Nikoleli, 2016-03-12 This book offers comprehensive coverage of biomarker biosensor interactions for the rapid detection of weapons of bioterrorism as well as current research trends and future developments and applications It will be useful to researchers in this field who are interested in new developments in the early detection of such The authors have collected very valuable and in some aspects indispensable experience in the area i e in the development and application of portable biosensors for the detection of potential hazards Most efforts are centered on the development of immunochemical assays including flow lateral systems and engineered antibodies and their fragments In addition new approaches to the detection of enzyme inhibitors direct enzymatic and microbial detection of metabolites and nutrients are elaborated Some realized prototypes and concept devices applicable for the further use as a basis for the cooperation programs are also discussed There is a particular focus on electrochemical and optical detection systems including those employing carbon nanotubes quantum dots and metalnanoparticles The authors are well known scientists and most of them are editors of respected

international scientific journals Although recently developed biosensors utilize known principles the biosensing devices described can significantly shorten the time required for successful detection and enhance efforts in more time consuming directions e g remote sensing systems and validation in real sample analysis The authors describe advances in all stages of biosensor development theselection of biochemical components their use in biosensor assembly detection principles and improvements and applications for real sample assays
