Cryopreservation of Plant Germplasm II L.E. Towill, Y.P.S. Bajaj, 2013-03-14 Ex situ preservation of germplasm for higher plant species has been accomplished using either seeds or clones but storage of these under typical conditions does not provide the extreme longevities that are needed to minimize risk of loss Costs of maintenance and regeneration of stocks are also high Systems that provide virtually indefinite storage should supplement existing methods and it is within this context that cryopreservation is presented The use of low temperature preservation was initially more a concern of medicine and animal breeding and was expanded to plants in the 1970s Survival after cryogenic exposure has now been demonstrated for diverse plant groups including algae bryophytes fungi and higher plants If survival is commonplace then the eventual application is a cryopreservation system whereby cells tissues and organs are held indefinitely for use often in the unforeseen future The increasing interest and capabilities for application could not have occurred at a more opportune time since expanding human populations have placed unprecedented pressures on plant diversity This book emphasizes cryopreservation of higher plants and was initially driven by the concern for loss of diversity in crops and the recognized need that this diversity would be essential for continued improvement of the many plants used by society for food health and shelter The interest in cryopreservation has been expanded by conservationists and their concerns for retaining as much as possible the diversity of natural populations The need for cryopreservation thus is well established

Emerging Sustainable Technologies for Biofuel Production Maulin Shah,Deepanwita Deka,2024-03-28 This book is presented on biofuel production which includes different

technologies developed and adopted to synthesize green renewable fuel alternatives for sustainable development. It also reflects different sources of biofuel application of microbial community and microbial engineering to design fuel production and the biosynthetic pathways of biofuel production by microbes. Although the expenses for the physical and chemical technologies for energy production and fossil fuel utilization to protect our environment are very high, these technologies are not eco friendly and safe. Hence the need of certain modern eco friendly and cost effective techniques to protect our environment is deeply apprehended by different workers of this field. These techniques involve some feasible technologies utilizing different biological agents like microbes to produce renewable energy. This book provides an outline of the science behind the multidisciplinary aspects of biofuel production. It summarizes a solid foundation in the fundamentals and progresses to practical applications in this field. It structures stepwise route for a number of effective techniques to screen, select, identify and utilize microbes for biofuel production and utilization. It also focuses on the theoretical groundworks of biofuel production, recent technologies related to microbial engineering like myco engineering technologies, microbial metabolism or modelling approaches to microbial physiology utilized for the same purpose. The techniques covered in this book ensure that scientists have the knowledge to practice effective biofuel production techniques themselves in a contaminated ecosystem in a sustainable way. Recent progress in the field of biofuels using microbial genetic engineering has larger perspectives in commercial scale production. However its large scale production is still challenging, hence to resolve this problem it is essential to convert biomass into biofuels by developing novel technology to increase biofuel production to fulfil the current and future energy demand.
