Fatigue of Welded Structures Timothy Russell Gurney, 1979-12-20 Investigation of Weldability of Hot-work Tool Steels N. A. Sinclair, J. G. Maciora, R. P. Sopher, 1961 The weldability of 6 hot work tool steels was investigated to develop optimum welding procedures Welds were made in sheet and plate with the inert gas tungsten arc and inert gas consumable electrode processes under various welding conditions Variations in preheat postheat and energy input had statistically significant but practically unimportant effects on mechanical properties after hardening and tempering Most mechanical test failures were initiated in the welds whether or not defects were present The weld metal retained its heterogeneous microstructure after hardening and tempering even when previously subject to annealing type heat treatments Lehigh restraint tests studies indicated that hot and cold cracking can occur Low temperature cracking can be prevented by increasing the preheat temperature Large radius Charpy impact specimens were found to be more satisfactory than the V notched specimens for these steels The high temperature weld tensile strength at 1000 F was 190 000 psi for an H 11 steel it was reduced to 156 000 after holding at 1000 F for 24 hours
