

Geology

Terms to Know

- Weathering:** The breaking down and changing of rocks and minerals due to natural processes.
- Erosion:** The process of soil, rocks, and other sediments being carried away or moved by natural forces such as wind, water, and ice.
- Deposition:** When bits of soil, rocks, and other sediments settle in a new place.

Layers of the Earth

The Earth has layers. The deeper you go, the hotter it gets.

- Crust:** The thin, outermost layer of the Earth. It is composed of solid rock.
- Mantle:** The largest layer of the Earth. It is between the crust and the outer core. It is made of molten rock.
- Outer Core:** The liquid layer of the Earth. It is between the mantle and the inner core. It is made of molten iron and nickel.
- Inner Core:** A solid sphere in the center of the Earth. It is made of molten iron and nickel.

Igneous Rocks

Rocks formed when lava or magma cools and hardens.

Earth's Movements

Divergent Boundaries

- Plates move apart from each other.
- Results in volcanoes and mountain formation.

Convergent Boundaries

- Plates move toward each other.
- Results in earthquakes and mountain formation.

The rock cycle is a process that shows how rocks change over time. It starts with rocks breaking down into smaller pieces through weathering and erosion. These small pieces, called sediments, are carried away by wind or water. These sediments collect in layers and become sedimentary rocks. Over time, heat and pressure turn sedimentary rocks into metamorphic rocks. Metamorphic rocks can then melt and become igneous rocks. Igneous rocks can also weather and erode, starting the cycle over.

Thermal Energy

Earth's thermal energy causes movement within it. It creates currents in the mantle that move the Earth's tectonic plates. This movement can result in earthquakes, volcanoes, and mountain formation.

A cross-sectional diagram of the Earth showing its internal layers. The layers are labeled from the center outwards: Inner Core (yellow), Outer Core (orange), Mantle (light orange), and Crust (thin brown layer on the surface). The diagram is set against a background of a globe showing continents and oceans.

- **Crust:** The thin, outermost composed of solid rock.
- **Mantle:** The largest layer and the outer core. It is made of solid rock.
- **Outer Core:** The liquid layer of the core.
- **Inner Core:** A solid sphere in the center of Earth. It is made of material called nickel.

Abstract

The rock cycle is a process that shows how rocks can change over time. It starts with rocks breaking down into smaller pieces through weathering and being carried away by erosion. These small pieces compact into sedimentary rocks. With heat and pressure, these sedimentary rocks can transform into metamorphic rocks. If the rocks melt and cool down, they can become igneous rocks. This cycle keeps repeating over millions of years.

Fossils are the remains or traces of plants and animals that lived long ago. By studying fossils found in different rock layers, scientists can make inferences about what the Earth was like a long time ago.
