

Home Automation

Home automation is the automated or remote control of appliances and equipment in the home. Automated controls can be used to turn equipment on or off or adjust the operating settings at pre-determined times, on-site or remotely, or can be set to adjust the operation of equipment in response to changes in the home environment, eg. temperature. Homes using these techniques, which may also involve the integration of broadband communications, are sometimes called **Smart Homes** or **Smart Houses**.

Home automation can either be centralised and programmable, or consist of decentralised and isolated sensors and controls. It can involve sophisticated electronic programmable controls for lighting, heating, cooling and entertainment devices using a special wiring or wireless controls, or just a few isolated systems being automated, such as motion sensors to control lights.

Home automation systems can only improve the energy efficiency of your home if they are designed for this purpose.

Operating automated systems uses energy, so the automated systems will only lead to energy savings if they save more energy than they use.

Priority should first be given to designing an energy efficient home and installing high energy efficient appliances and lighting. Home automation can save energy if it reduces the time that equipment operates or reduces the need to use equipment, eg. by only switching on lights when they are needed.

Aim to design home automation systems to reduce the need for operating or the time that energy-using equipment operates.

Heating and cooling

A well designed automation system can:

1. Improve passive solar heating and passive cooling through the control of blinds, awnings, windows, vents and fans.
2. Control heaters and air conditioners so they are only used when and where they are needed and are used to achieve a desired temperature.

Design your home to make the best use of solar energy and natural ventilation for passive heating and cooling before you consider your automation options. [See: 4.5 Passive Solar Heating; 4.6 Passive Cooling]

Use temperature sensors in different rooms to control heating and cooling. Appropriate placement of temperature sensors and the use of heating/AC timers can significantly reduce energy use, even if automated systems are not used.

Analyse your heating/cooling needs and how you will manage these. Ask yourself what rooms need to be heated/cooled, when and to what temperature? Aim to heat/cool living areas when people are home but heat/cool

bedrooms only at night and the early morning when they occupied. Bedrooms do not need to be made as warm or as cool as living areas, to be comfortable for sleeping. Avoid heating and cooling halls, laundries etc. [See: 4.2 Design for Climate]

Plan your automation system. Consider how opening and closing blinds, awnings, windows and vents can assist passive heating, cooling and natural lighting. Explore how switching on and off of fans and heat shifters might reduce the need for cooling or heating. Consider how better temperature and the timing of use can minimise the energy used in heaters and air conditioners/coolers. Use these answers to decide on your automation needs.
