Abstract— An uniform circular array (UCA) structure with four-element antennas is proposed to perform Angle-Of-Arrival (AOA) estimation at the receiver in IR-UWB indoor positioning system. A novel algorithm named Common-Rhythm Detection is proposed to estimate Time difference of arrival (TDOA). The performances of TDOA estimation algorithms have been compared based on UCA receiver. The accuracy of estimated AOA has been evaluated. UCA structure is verified to be useful to estimate AOA by simulation and measurement results.

Keywords – ultra wideband, time difference of arrival, Angle of arrival, positioning

I. INTRODUCTION

Impulse radio ultra wideband (IR-UWB) has been envisaged as a radio technology to implement accurate positioning and tracking. Due to its impulse-like pulse shape, IR-UWB features good immunity to multi-path fading and high accuracy TOA/AOA estimation. Many positioning techniques based on TOA/TDOA have been studied in the past. TOA technique requires two way communication and implements ranging between nodes. In TDOA, accurate synchronization between anchor nodes is required which is usually achieved by long cable connections between them. Those implementation related issues can be overcome by using AOA.

AOA is implemented by computing TDOA between antenna elements which are in close proximity thus shortening the cable connections between them. The geometric arrangement of the antenna elements and accuracy of TDOA measurement affect the AOA estimation accuracy. One conclusion have been made in [1], that is the uniform circular array (UCA) can provide better AOA estimates and is more robust to different AOA than the uniform linear array (ULA). Uniform circular array (UCA) has also been employed in radar systems to implement direction finding [2].

In this paper, different AOA estimation algorithms based on UCA are studied using experimental measurements. In the first algorithm, Modified Phase-only Correlator (MPOC) [3] is used to compute the TDOA between signals received at the antenna elements. The second algorithm uses Sum & Difference of the received IR-UWB signals from the different antenna elements. The experimental results show that the effectiveness of both MPOC and Sum-Diff are restricted by the distortion level of received IR-UWB signal pulse shape. A Common-Rhythms Detection is proposed to improve the accuracy of TDOA estimation. The advantage of Common-

Rhythms Detection is that it can tolerate less accuracy of TOA estimation. Actual measurement is conducted to verify the algorithm. The estimated values are given to compare with the practical orientation angles.

The AOA positioning model will be introduced in section II, followed by the performance of TDOA evaluation algorithms in section III. Measurement results will be presented in section IV. The paper is concluded in section V.

Figure II-1 Platforms of UCA receiver

As indicated in Figure II-1, Rx1, Rx2, Rx3 and Rx4 refer to four bi-conical antenna elements of UCA respectively, which are uniformly distributed on the circumference with a quarter meter radius. θ is the biasing angle with respect to the north of UCA. Assuming that all antenna elements has the same multipath channel and the multipath impulse response corresponding to Rx1 is $h(r)$, then the channel impulse responses for Rx2, Rx3 and Rx4 can be seen as time-delayed versions of $h(r)$. The relationship between Rx1 to Rx4 in time domain and frequency domain is:

Uniform Circular Antenna Array Applications in Coded DS-CDMA Mobile Communication Systems Tian Beng Seow, 2003-03 Presently the uniform linear array ULA is the most commonly used antenna system for a sectorized cell system like commercial cellular systems However in many omni directional cell communication systems such as ground based military communications interest in using the uniform circular array UCA has greatly increased This thesis examines the use of an equally spaced circular adaptive antenna array at the mobile station for a typical coded direct sequence code division multiple access DS CDMA communication system The author analyzed the performance of a randomly orientated adaptive UCA in the forward channel base station to mobile station of a coded multi cell DS CDMA system Using a 3 and 4 element UCA the capacity and performance of different cellular systems under a range of shadowing conditions with and without antenna sectoring at the base station and for various user capacities were simulated using the Monte Carlo method The results for both ULA and UCA are compared and presented in this thesis The simulation results show that generally the performance of the system with the adaptive UCA is better than or at least on par with the system with the adaptive ULA In addition the 4 element adaptive array can null out up to three interfering signals thereby increasing the system s capacity Furthermore sectoring techniques significantly reduced the amount of inter cell interference and improved the system s performance thereby increasing the number of mobile stations allowed within the cell The capacity of the system with the 3 and 4 element adaptive UCA was increased by 5.8 times with 60 degree sectoring and 2.8 times with 120 degree sectoring respectively 37 figures 9 refs **Electrical & Electronics Abstracts** ,1997 [Dissertation Abstracts International](#) ,2008

mobile terminal equipped with a linear array and a tapped delay line is analyzed It has been demonstrated that the optimization process has been extremely computationally expensive and hence minimum taps should be used for practical consideration The results illustrated that in general for a 2 element linear array system a 3 tap delay line would be sufficient to equalize the broadband signal while providing a similar performance level to that of a narrow band adaptive array system In the case of a 3 element linear array system a 2 tap delay line would suffice
