Devices and Techniques for Multiple-applicator Tumor Ablation Paul F. Laeseke, 2007 *Old Versus New - Tumor Ablation Versus Tumor Nanoablation with Particular Emphasis on Liver Tumors* Zeno Sparchez, 2015 Loco regional treatments play a key role in the management of hepatocellular carcinoma HCC Image guided tumor ablation is recommended in patients with early stage HCC when surgical options are precluded Radiofrequency ablation is currently established as the standard method for local tumor treatment Despite major advances in tumor ablation techniques the disease recurs in a high proportion of cases A major limitation in its overall

effectiveness is due to the difficulties of heating large tumors. Small regions of viable tumor may still remain even after apparently good tumor ablation by perfusion mediated tissue cooling preventing the whole tumor reaching a sufficient temperature for coagulation and necrosis. Moreover simple heating techniques have trouble discriminating between tumors and surrounding healthy tissues leading to many side effects. In order to overcome these major limitations numerous groups are investigating the use of energy absorbing agents localized within tumor tissues to facilitate localized heating. A personal answer based on the review of the literature will be offered to the following questions: NIR photothermal therapy, RFA with nanoparticles or magnetic fluid hyperthermia for the long term management of HCC. How should we deliver nanoparticles systemically or directly intratumoral? Ablation versus mild hyperthermia. Pros and Cons in the majority of cases hyperthermia is applied in one of two ways: a high temperature for short time periods commonly referred to as ablation or b lower temperatures for long time periods often called mild hyperthermia. The former is used to kill cells directly with heat and consequently can be used to thermally ablate tumor. The second method is just above physiological temperature and these temperatures are more often used to trigger release from thermosensitive drug carriers. Both approaches can be combined with heat sensitive drug targeting. There are many ways to induce nanoparticle mediated thermal therapy in solid tumors including absorption of infrared light, radiofrequency ablation and magnetically induced heating. These approaches have demonstrated high efficacy in preclinical models of HCC and are already tested in human clinical trials.

Tumor Ablation and Immunity Yueyong Xiao, Ming Kuang, Nikolai Korpan, 2024-02-29

Tumor Ablation Eric van Sonnenberg, William McMullen, Luigi Solbiati, 2008-09-08

There is an enormous sense of excitement in the communities of cancer research and cancer care as we move into the middle third of the first decade of the 21st century. For the first time there is a true sense of confidence that the tools provided by the human genome project will enable cancer researchers to crack the code of genomic abnormalities that allow tumor cells to live within the body and provide highly specific virtually non toxic therapies for the eradication or at least long term control of human cancers. There is also good reason to hope that these same lines of inquiry will yield better tests for screening, early detection and prevention of progression beyond curability. While these developments provide a legitimate basis for optimism many patients will continue to develop cancers and suffer from their debilitating effects even as research moves ahead. For these individuals it is imperative that the cancer field make the best possible use of the tools available to provide present day cancer patients with the best chances for cure, effective palliation or at the very least relief from symptoms caused by acute intercurrent complications of cancer. A modality that has emerged as a very useful approach to at least some of these goals is tumor ablation by the use of physical or physiochemical approaches.

Maithel,2018-10-01 The incidence of primary and metastatic liver tumors is rising and the therapeutic armamentarium for these tumors is expanding at a rapid pace Surgery remains the primary treatment modality for these tumors With improvements in our perioperative management and operative techniques a larger proportion of patients are able to undergo potentially curative liver surgery In addition indications and criteria for liver transplantation for both primary and metastatic liver tumors are constantly expanding Unfortunately many patients are not amendable to surgical resection or liver transplantation and therefore alternative liver directed therapies are routinely being implemented as part of complex multidisciplinary treatment models However these models are continually evolving as these regional therapeutic

options continue to expand New embolization agents and techniques as well as improvements in radiation delivery are all evolving in the background of improvement in systemic and targeted therapy options for these tumors This book provides a comprehensive state of the art review of the current state of liver directed therapy for malignant liver tumors The book will serve as a valuable resource for not only surgeons and clinicians but for researchers with an interest in malignant liver tumors The book focuses on the therapeutic approach to primary and metastatic tumors providing an up to date review on surgical liver anatomy and new imaging techniques as well as patient selection and technical consideration for resection and transplantation In addition the book provides new insight into novel and evolving therapies in the areas of transarterial therapy such as i bland embolization ii chemoembolization and iii radioembolization as well as new radiation techniques including SBRT and proton therapy Furthermore the expanding role of hepatic artery infusion therapy in primary malignant tumors is highlighted Finally integration of all these regional therapy options with upcoming and evolving systemic and targeted therapy regimens are integrated and discussed This book will serve as a very useful resource for clinicians and researchers managing and treating patients with these challenging malignancies It provides a concise yet comprehensive summary of the current status of the field that will help guide patient management and stimulate investigative efforts All chapters are written by experts in their fields and include the most up to date scientific and clinical information
