*Demand-based Data Stream Gathering, Processing, and Transmission* Jonas Traub, 2021-04-09 This book presents an end to end architecture for demand based data stream gathering processing and transmission The Internet of Things IoT consists of billions of devices which form a cloud of network connected sensor nodes These sensor nodes supply a vast number of data streams with massive amounts of sensor data Real time sensor data enables diverse applications including traffic aware navigation machine monitoring and home automation Current stream processing pipelines are demand oblivious which means that they gather transmit and process as much data as possible In contrast a demand based processing pipeline uses requirement specifications of data consumers such as failure tolerances and latency limitations to save resources Our solution unifies the way applications express their data demands i.e. their requirements with respect to their input streams This unification allows for multiplexing the data demands of all concurrently running applications On sensor nodes we schedule sensor reads based on the data demands of all applications which saves up to 87% in sensor reads and data transfers in our experiments with real world sensor data Our demand based control layer optimizes the data acquisition from thousands of sensors We introduce time coherence as a fundamental data characteristic Time coherence is the delay between the first and the last sensor read that contribute values to a tuple A large scale parameter exploration shows that our solution scales to large numbers of sensors and operates reliably under varying latency and coherence constraints On stream analysis systems we tackle the problem of efficient window aggregation We contribute a general aggregation technique which adapts to four key workload characteristics Stream dis order aggregation types window types and window measures Our experiments show that our solution outperforms alternative solutions by an order of magnitude in throughput which prevents expensive system scale out We further derive data demands from visualization needs of applications and make these data demands available to streaming systems such as Apache Flink This enables streaming systems to pre process data with respect to changing visualization needs Experiments show that our solution reliably prevents overloads when data rates increase
