Troubleshooting Process Operations 4th Edition

Osvaldo A. Bascur

Troubleshooting Process Operations 4th Edition:

Troubleshooting Process Plant Control Norman P. Lieberman, 2011-09-20 The book focuses on process control in the petroleum and refinery industries with an emphasis on problem solving. The author explores various real life examples and relays the lessons learned from his career in this area. He explains many new yet straightforward concepts without the use of complex mathematics. This handy go to emphasizes single and well established process engineering principles that will help working engineers and operators switch manual control loops to automatic control.

Troubleshooting Process Operations Norman P. Lieberman, 2009 Drawing on his passion training and experience Lieberman presents problems and troubleshooting techniques that are associated with specific processes systems and equipment leading novice and practiced troubleshooters alike to the crux of malfunctions and failures. The fourth edition updates troubleshooting and design techniques and adds seven new chapters with information on turbines motors heat exchangers and environmentally friendly operations. Norm Lieberman sprinkles his troubleshooting guide with insightful and humorous anecdotes from 45 years in the petrochemical and refining industry. Features Nitty gritty descriptions of common refinery and chemical plant problems and the diagnostic field observations experiments and calculations that reveal their origin. Troubleshooting checklists and references following each chapter. Practical advice for optimizing interactions with key plant operations personnel.

Troubleshooting Vacuum Systems Norman P. Lieberman, 2012-12-03 Vacuum systems are in wide spread use in the petrochemical plants petroleum refineries and power generation plants. The existing texts on this subject are theoretical in nature and only deal with how the equipment functions when in good mechanical conditions from the viewpoint of the equipment vendor. Also the existing texts fail to consider the interaction of the vacuum system with the process equipment it serves and the variability of the motive steam conditions change in cooling water temperature condenser fouling and erosion of the ejectors. Here are some of the many questions answered in this groundbreaking volume. Why does my first stage jet make a surging sound during hot weather? Why does the vacuum suddenly break? I've seen moisture condensing on the jet's body. What's causing that? Why do I have to steam out the drain legs from our condensers? Superheated steam is making our vacuum worse. Is this normal? How can I locate and measure air leaks? Reducing the steam pressure to my jets improves vacuum. But why I can't pull the pre condenser bundle. The shell side is fouling. What should I do? We're not getting our normal horsepower from our steam turbine. Could this be a jet problem? Raising the seal drum level improves vacuum. Is there an explanation for this? Our turbine exhaust steam pressure to our surface condenser has doubled in the last two years. What should we do? Restricting cooling water flow from our elevated condensers improves vacuum. Is this possible? What's a converging diverging ejector all about? What's the difference between a barometric condenser and a surface condenser? Which is better?
