

Since the derivative is itself a function, we can calculate its derivative. This is called the second derivative and, as we will see, it also gives us useful information about the original function.

$$\frac{d}{dx} \left(\frac{dy}{dx} \right) \rightarrow \frac{d^2 y}{dx^2} \quad \left(\begin{array}{l} \text{not a} \\ \text{power!} \end{array} \right)$$

First, let's look at some notation. Let $y = f(x)$.

First derivative:

$$f'(x), y', \frac{dy}{dx}$$

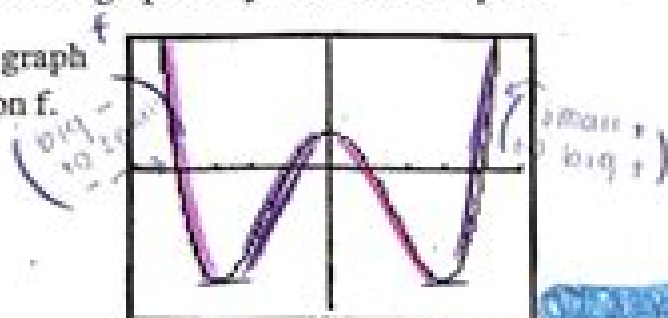

Second derivative:

$$f''(x), y'', \frac{d^2 y}{dx^2}$$

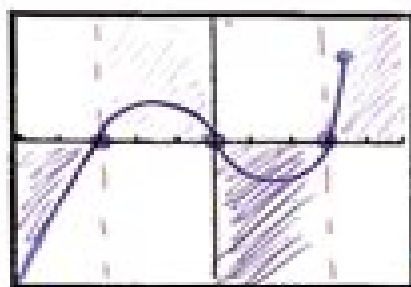

Question: What information does the second derivative tell us?

Let's look at this graphically with an example. *Draw tangent lines!*

This is the graph of a function f .

Sketch the graph of the derivative, f' .

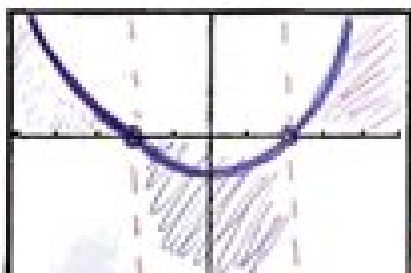

Recall the information that the derivative tells us about a function.

On an interval,

- if $f' > 0$, then f is increasing

- if $f' < 0$, then f is decreasing

Sketch the graph of the derivative of f' , f'' .

Since f'' is the derivative of f' , we have:

On an interval,

- if $f'' > 0$, then f' is increasing

- if $f'' < 0$, then f' is decreasing

* if f' is increasing f is concave up.
if f' is decreasing f is concave down
