rate of anthropogenic activities which involve the release of different types of contaminants into the aquatic environment. This generates high environmental risks which could affect health and socio economic activities if not treated properly. There is no doubt that the rapid progress in improving water quality and management has been motivated by the latest developments in green chemistry. Over the past decade sources of water pollutants and the conventional methods used for the treatment of industrial wastewater treatment have flourished. Water quality and its adequate availability have been a matter of concern worldwide particularly in developing countries. According to a World Health Organization WHO report more than 80% of diseases are due to the consumption of contaminated water. Heavy metals are highly toxic and are a potential threat to water, soil and air. Their consumption in higher concentrations gives hazardous outcomes. Water quality is usually measured in terms of chemical, physical, biological and radiological standards. The discharge of effluent by industries contains heavy metals, hazardous chemicals and a high amount of organic and inorganic impurities that can contaminate the water environment and hence human health. Therefore it is our primary responsibility to maintain the water quality in our respective countries. This book provides understanding, occurrence, identification, toxic effects and control of water pollutants in an aquatic environment using green chemistry protocols. It focuses on water remediation properties and processes including industry scale water remediation technologies. This book covers recent literature on remediation technologies in preventing water contamination and its treatment. Chapters in this book discuss remediation of emerging pollutants using nanomaterials, polymers, advanced oxidation processes, membranes and microalgae bioremediation etc. It also includes photochemical, electrochemical, piezoacoustic and ultrasound techniques. It is a unique reference guide for graduate students, faculties, researchers and industrialists working in the area of water science, environmental science, analytical chemistry and chemical engineering. This outstanding new volume Provides an in depth overview of remediation technologies in water science. Is written by leading experts in the field. Contains excellent well drafted chapters for beginners, graduate students, veteran engineers and other experts alike. Discusses current challenges and future perspectives in the field. Audience: This book is an invaluable guide to engineers, students, professors, scientists and R D industrial specialists working in the fields of environmental science, geoscience, water science, physics and chemistry.
