

Understanding DVT

Deep Vein Thrombosis

What is the Venous System?

The venous system is the part of the circulatory system that carries blood from the tissues back to the heart. It is a complex network of veins that branch out from the heart and merge back into it. The venous system is responsible for returning oxygenated blood to the heart and carrying deoxygenated blood to the lungs for oxygenation.

How valves work:

Two sets of valves, known as venous valves, are located in the veins. These valves prevent blood from flowing back down the vein, ensuring that blood flows in one direction towards the heart. The valves are made of thin, flexible tissue and are located at regular intervals along the vein.

Symptoms and Risk Factors of DVT

The most common symptom of DVT is a swollen, painful leg. Other symptoms include redness, warmth, and tenderness in the affected area. Risk factors for DVT include prolonged immobility, surgery, trauma, and certain medical conditions.

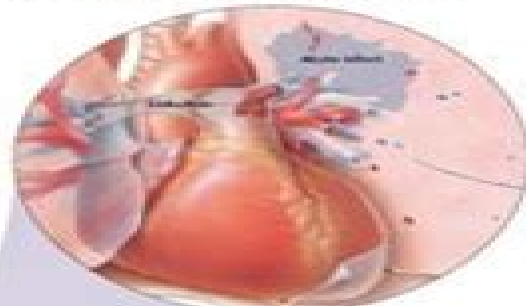

The formation of blood clots

The venous system is designed to allow blood to flow back to the heart against gravity. However, if the blood flow is slowed or stopped, it can lead to the formation of a blood clot. This is because the blood is more likely to coagulate when it is not moving. The formation of a blood clot is a natural process that helps to stop bleeding from a wound.

What is DVT?

DVT is a blood clot that forms in a deep vein, usually in the leg. It is a serious condition because the clot can break off and travel through the bloodstream to the lungs, where it can cause a pulmonary embolism. DVT is often caused by prolonged immobility, surgery, and certain medical conditions.

What is a Pulmonary Embolism?

A pulmonary embolism is a blood clot that has traveled from the leg to the lungs. It is a life-threatening condition because it can block the flow of blood to the lungs, causing them to become damaged. Symptoms include chest pain, shortness of breath, and coughing up blood.

Chronic Venous Insufficiency

Chronic venous insufficiency is a condition in which the veins in the leg are unable to pump blood back to the heart effectively. This can lead to swelling, pain, and skin changes in the affected leg. It is often caused by damage to the valves in the vein.

This illustration demonstrates the changes in the leg when DVT is present. A swollen, painful leg is shown, with the clot located in the deep vein. The diagram also shows the location of the clot in the vein.

Taking Control of your DVT

There are several ways to prevent DVT, including wearing compression stockings, staying active, and avoiding prolonged immobility. If you have DVT, it is important to follow your doctor's instructions and take your medication as prescribed.

Treatment and Diagnosis of DVT

DVT is typically treated with blood thinners, which help to prevent the clot from growing larger. In some cases, surgery may be needed to remove the clot. Diagnosis is usually made through a blood test and ultrasound.
