Transfer Operators, Endomorphisms, and Measurable Partitions Sergey Bezuglyi, Palle E. T. Jorgensen, 2018-06-21 The subject of this book stands at the crossroads of ergodic theory and measurable dynamics With an emphasis on irreversible systems the text presents a framework of multi resolutions tailored for the study of endomorphisms beginning with a systematic look at the latter This entails a whole new set of tools often quite different from those used for the easier and well documented case of automorphisms Among them is the construction of a family of positive operators transfer operators arising naturally as a dual picture to that of endomorphisms The setting close to one initiated by S Karlin in the

context of stochastic processes is motivated by a number of recent applications including wavelets multi resolution analyses dissipative dynamical systems and quantum theory The automorphism endomorphism relationship has parallels in operator theory where the distinction is between unitary operators in Hilbert space and more general classes of operators such as contractions There is also a non commutative version While the study of automorphisms of von Neumann algebras dates back to von Neumann the systematic study of their endomorphisms is more recent together with the results in the main text the book includes a review of recent related research papers some by the co authors and their collaborators
