Wavelet Subdivision Surfaces Charles Chui, Qintang Jiang, 2014-11-26 With the use of bivariate wavelets the applications of wavelets to surface subdivision methods becomes much more powerful than the use of biorthogonal wavelets This book illustrates how symmetry can be used to improve surface visual quality and how the matrix valued surface subdivision stencils that are included allow for the prediction of tangent planes and unit surface from the coarse control net The text offers an up to date rigorous treatment of wavelet and frame based surface multi resolution

theory algorithms and methods together with matrix valued and conventional surface subdivision schemes integrated in a unified wavelet subdivision mathematics toolbox

Wavelets, Images, and Surface Fitting Pierre-Jean Laurent,Alain Le Méhauté,Larry Schumaker,1994-07-15 This volume documents the results and presentations relating to the use of wavelet theory and other methods in surface fitting and image reconstruction of the Second International Conference on Curves and Surfaces held in Chamonix in 1993 The papers represent directions for future research and development in many areas of application

An Adaptive Subdivision Method with Crack Prevention for Rendering Beta-spline Objects University of California, Berkeley. Computer Science Division,Brian A. Barsky,Tony D. DeRose,Mark D. Dippe,1987 Adaptive subdivision is a method of creating polygonal approximations to spline surfaces An adaptive subdivision algorithm takes an input a spline surface and a tolerance epsilon and outputs a piecewise planar approximation to the surface that is guaranteed to differ from the actual surface by a distance no greater than epsilon These algorithms proceed by recursively splitting the surface into smaller subsurfaces ultimately approximating subsurfaces with planar polyhedra These algorithms are therefore characterized by the mathematics behind the splitting of a surface the test that is used to determine when to stop the recursion and the method by which a subsurface is approximated by polyhedra Algorithms of this type are currently known for spline techniques such as Bezier and B splines This paper describes the Beta spline curve and surface technique and derive the equations governing the splitting of Beta spline curves and surfaces It presents a very general adaptive subdivision algorithm that can be used with a variety of surface techniques It incorporates splitting criteria based on flatness and prevents cracks from occurring between approximating polyhedra The tolerance controlling the splitting process may itself be adaptive so that as an object moves farther away the tolerance is automatically increased

Diffusion-Driven Wavelet Design for Shape Analysis Tingbo Hou,Hong Qin,2014-10-22 From Design Methods and Generation Schemes to State of the Art Applications Wavelets are powerful tools for functional analysis and geometry processing enabling researchers to determine the structure of data and analyze 3D shapes Suitable for researchers in computer graphics computer vision visualization medical imaging and geometric modeling as well as graduate and senior undergraduate students in computer science Diffusion Driven Wavelet Design for Shape Analysis presents recent research results in wavelet designs on 3D shapes and their applications in shape analysis It explains how to apply the design methods to various types of 3D data such as polygonal meshes point clouds manifolds and volumetric images Extensions of Wavelet Generation on Volumetric and Manifold Data The first part of the book introduces design methods of wavelets on manifold data incorporating interdisciplinary knowledge from differential geometry functional analysis Fourier transform spectral graph theory and

stochastic processes The authors show how wavelets are purely determined by the shape geometry and how wavelet transforms are computed as inner products of wavelet kernels and input functions Wavelets for Solving Computer Graphics Problems The second part presents applications in shape analysis representation The book looks at wavelets as spectral tools for geometry processing with filters in a joint space frequency domain and examines wavelets as detail extractors for shape feature definition and detection Going beyond these fundamental applications the book also covers middle and high level applications including shape matching shape registration and shape retrieval Easy to Understand Implementations and Algorithms Unlike many other wavelet books this one does not involve complicated mathematics Instead the book uses simplified formulations and illustrative examples to explain deep theories Code and other materials are available on a supplementary website

Wavelets and Singular Integrals on Curves and Surfaces Guy David,1991-07-10 Wavelets are a recently developed tool for the analysis and synthesis of functions their simplicity versatility and precision makes them valuable in many branches of applied mathematics The book begins with an introduction to the theory of wavelets and limits itself to the detailed construction of various orthonormal bases of wavelets A second part centers on a criterion for the L^2 boundedness of singular integral operators the T b theorem It contains a full proof of that theorem It contains a full proof of that theorem and a few of the most striking applications mostly to the Cauchy integral The third part is a survey of recent attempts to understand the geometry of subsets of R^n on which analogues of the Cauchy kernel define bounded operators The book was conceived for a graduate student or researcher with a primary interest in analysis and preferably some knowledge of harmonic analysis and seeking an understanding of some of the new real variable methods used in harmonic analysis

Wavelet Approach to Data Analysis, Manipulation, Compression, and Communication ,2007 The main objective of our research program over the past three year period is three fold firstly mathematical theories and methods as well as construction of basis functions for multi level approximation and analysis with emphasis on scattered data interpolation and representation were developed secondly based on minimum energy criteria new data processing tools particularly variational algorithms and optimal wavelet thresholding methods with applications to

image restoration were introduced and finally these developments were applied to data representation manipulation rendering and communication as well as to solutions of various specific problems in computer graphics In particular the standard approach to subdivision schemes by constructing templates of scalar values is extended to matrix valued subdivisions to gain flexibility and smaller template sizes for the main purpose of achieving twice continuously differentiable surfaces with more desirable geometric shapes and arbitrary topologies As a result one ring templates for interpolating surface subdivisions are introduced in this project for a wide range of applications including reversed engineering surface interpolation of medical and geospatial data and visualization of point clouds The theories and methods developed in this project have also been applied to designing algorithms for various applications in computer graphics including adaptive stroke based sketching with editing features non photo realistic graphic drawings rendering and animation as well as wavelet based digital image restoration
