Transport in Laser Microfabrication Costas P. Grigoropoulos, 2005 Provides researchers and practitioners with the technical background to understand transport phenomena in laser microfabrication applications

Transport in Laser Microfabrication Costas P. Grigoropoulos, 2009-07-30 Emphasising the fundamentals of transport phenomena this book provides researchers and practitioners with the technical background they need to understand laser induced microfabrication and materials processing at small scales It clarifies the laser materials coupling mechanisms and discusses the nanoscale confined laser interactions that constitute powerful tools for top down nanomanufacturing In addition to discussing key and emerging applications to modern technology with particular respect to electronics advanced topics such as the use of lasers for nanoprocessing and nanomachining the interaction with polymer materials nanoparticles and clusters and the processing of thin films are also covered

Handbook of Flexible Organic Electronics Stergios Logothetidis, 2014-12-03 Organic flexible electronics represent a highly promising technology that will provide increased functionality and the potential to meet future challenges of scalability flexibility low power consumption light weight and reduced cost They will find new applications because they can be used with curved surfaces and incorporated in to a number of products that could not support traditional electronics The book covers device physics processing and manufacturing technologies circuits and packaging metrology and diagnostic tools architectures and systems engineering Part one covers the production properties and characterisation of flexible organic materials and part two looks at applications for flexible organic devices Reviews the properties and production of various flexible organic materials Describes the integration technologies of flexible organic electronics and their manufacturing methods Looks at the application of flexible organic materials in smart integrated systems and circuits chemical sensors microfluidic devices organic non volatile memory devices and printed batteries and other power storage devices

Pulsed Laser Ablation of Solids Mihai Stafe, Aurelian Marcu, Niculae N. Puscas, 2013-11-09 The book introduces the state of the art of pulsed laser ablation and its applications It is based on recent theoretical and experimental studies The book reaches from the basics to advanced topics of pulsed laser ablation Theoretical and experimental fundamental phenomena involved in pulsed laser ablation are discussed with respect to material properties laser wavelength fluence and intensity regime of the light absorbed linearly or non linearly in the target material The energy absorbed by the electrons leads to atom molecule excitation ionization and or direct chemical bond breaking and is also transferred to the lattice leading to material heating and phase transitions Experimental non invasive optical methods for analyzing these phenomena in real time are described Theoretical models for pulsed laser ablation and phase transitions induced by laser beams and laser vapour plasma interaction during the plume expansion above the target are also presented Calculations of the ablation

speed and dimensions of the ablated micro and nano structures are performed The validity and required refinement of different models in different experimental conditions is provided The pulsed laser deposition process which bases on collecting the ablated particles on a surface is analyzed in terms of efficiency and quality of the deposited films as a function of ambient conditions target material laser parameters and substrate characteristics The interaction between the incident laser and the ablation plasma is analyzed with respect to its influence on the structures of the deposited films and its capacity to generate high harmonics and single attosecond pulses which are highly desirable in pump probe experiments
