Virtual Building Systems Coordination Using Navisworks Manage:

Virtual Building Systems Coordination Damon Socha, 2013-07-01 The process of virtual building systems coordination currently represents one of the leading methodologies for increasing profitability and productivity in the construction industry. Defined processes with appropriate software have enabled contractors and designers to build and design complex virtual systems with high levels of confidence. Confidence and detail provide for prefabrication of building systems and components, reducing the labor and excess materials necessary to fabricate and install building systems in a field setting. Some estimations place this labor and reduced materials figure up to 30%. While 30% may be an educated guess, the truth does hold true that preplanning and prefabrication of building components saves significant time and field labor. The key element in the prefabrication process is the ability to confidently coordinate building systems and components to a high level of accuracy. A highly defined process adaptable to the needs of a specific project provides the necessary level of accuracy and confidence. However, in concert with a defined process, internal changes to the business model and management must also occur. For various reasons, many companies do not leverage the technology in the most efficient and effective methods. In fact, many companies hold fast to established internal processes and attempt to force the technology to mold to their current market strategy and methodology. Choosing what to implement based on ease of implementation will rarely provide the desired results. While some efficiency gains can be realized by simply adding to established practices, more often than not, frustration and marginal profit increases are the result. A defined process using the Clash Detection system found in the Navisworks Manage software and the resulting virtually coordinated shop drawings provides a catalyst to confidence and prefabrication. However, improper or partially coordinated systems will often demonstrate that a particular level of effort is required to justify the cost. It is important to understand that the benefits of virtual coordination are not linear. There exists a level of coordination and effort that must be put forth to obtain the profitable results and recover the time and effort of the investment. The level of coordination that is required will differ for every project and will be dependent upon factors such as drawing completeness, building complexity, governing bodies of regulation, location, building uses, and systems complexity and code requirements. While a reasonable discussion of the entire coordination process, including prefabrication and field installation implementation, is warranted, it is not the scope of this book. The main purpose of this book is to provide all the necessary resources to effectively implement a successful virtual building systems coordination. The book is built for the novice and for the most experienced user. The novice will come to understand how to efficiently run an effective coordination process starting at ground zero. The expert will likely find nuggets of wisdom and refining practices to help their own process run more efficiently. The premise of the book then is a simple one. With a defined process and some simple management skills, one can effectuate a building systems coordination in which the field has confidence and ultimately one in which you will reap the rewards of the technology.

A Cyber-Physical Systems (CPS) Approach to Temporary Structures Monitoring Xiao Yuan, 2016 The construction industry has had a high record of structural failures and safety problems for decades Some of these problems such as occupational injuries quality of structure and speed of construction project are affected by temporary structures i.e. scaffolding temporary support system and

formwork system In many cases these temporary structures are regarded as static structures without appropriate monitoring of temporal changes in their stability To be specific it is estimated that three quarters of the construction workers in the United States work on or near temporary structures The improper management of temporary structures results in 100 deaths 4500 injuries and costs 90 million every year While significant deployments are being made in the structural health monitoring of constructed facilities such as bridges dams and other civil infrastructure inadequate attention has been paid to temporary structures Developments in information and communications technologies notably the advent of Cyber Physical Systems CPS are changing the way in which structures are monitored With the bidirectional coordination possible between physical artefacts and their virtual representations CPS offers an approach that can facilitate the monitoring and active control of temporary structures in such a way as to prevent structural failures and safety hazards on the job site This research focused on the development and validation of a Cyber Physical Systems approach to safety monitoring of the temporary structures widely used on the construction job site The objectives of the research include investigating CPS implementation in construction industry assessing CPS applicability to temporary structures reviewing safety regulations of temporary structures developing a CPS based prototype system for temporary structures monitoring and evaluating the performance of the prototype CPS system In order to conduct the research several research methods were utilized including literature reviews rapid prototyping laboratory experiments and an evaluation workshop In particular research problems were clarified through literature review In reviewing the key features of CPS enabling technologies and current applications in various industries were summarized to identify the opportunities for CPS use in tackling important problems in the construction industry To establish the applicability of CPS in temporary structures the safety issues of temporary structures were investigated to identify the failure patterns of some commonly used temporary structures The potential benefits and barriers of CPS application to temporary structures were also explored Based on the CPS applicability analysis a CPS prototype system for temporary structures monitoring was designed and developed by linking the virtual model based on the Navisworks Management platform and the physical structures This prototype system was tested through laboratory experiments under 5 failure scenarios and evaluated for performance by industry experts The evaluation of the developed CPS prototype system involved key industry experts and confirmed that CPS offers an effective approach to advanced monitoring of temporary structures the developed CPS prototype system works effectively in the monitoring of temporary structures and there are a number of benefits and barriers associated with CPS application to temporary structures In addition to the safety monitoring of scaffolding systems which was demonstrated as an example of temporary structures various potential application areas have been identified for CPS application to temporary structures monitoring While the proposed TSM method has provided an example of how to closely integrate the virtual model and the physical components of temporary structures for structural monitoring more applications and extensible benefits can be realized based on it In

general this research explored and validated CPS application for the monitoring of temporary structures It identified CPS benefits and applicability to the area of temporary structures monitoring developed a CPS prototype for the monitoring of temporary structures conducted experimental tests to check and refine the prototype system and conducted workshop evaluation of the prototype system for performance analysis By taking advantage of CPS this research provides a new approach to assisting safety superintendents in the monitoring of temporary structures through bi directional communication between physical structures and their virtual models This research has contributed to a deeper understanding of the potential of Cyber Physical Systems CPS to address critical problems in the construction industry using temporary structures monitoring as an effective example application Basic Principles of Modular Coordination United States.
