comers or other characteristic points in video images ground control points in aerial images anatomical landmarks in medical images prominent facial points used for biometric verification markers at human joints used for motion capture in virtual reality applications or in and outdoor landmarks used for autonomous navigation of robots This book covers the extraction of landmarks from images as well as the use of these features for elastic image registration Our emphasis is on model based approaches i e on the use of explicitly represented knowledge in image analysis We principally distinguish between geometric models describing the shape of objects typically their contours and intensity models which directly represent the image intensities i e the appearance of objects Based on these classes of models we develop algorithms and methods for analyzing multimodal images such as traditional 2D video images or 3D medical tomographic images **VOXEL MAN** Eppendorf Institut für Mathematik und Datenverarbeitung in der Medizin, K.
