information about the heart and vessels In this context three dimensional three directional cine phase contrast PC magnetic resonance imaging MRI commonly referred to as 4D Flow MRI arises as a powerful tool for creating personalized models 4D Flow MRI enables the measurement of time resolved velocity information with volumetric coverage Besides providing a rich dataset within a single acquisition the technique permits retrospective analysis of the data at any location within the acquired volume This thesis focuses on improving subject specific assessment of cardiovascular function through model based analysis of 4D Flow MRI data By using computational models we aimed to provide mechanistic explanations of the underlying physiological processes derive novel or improved hemodynamic markers and estimate quantities that typically require invasive measurements Paper I presents an evaluation of current markers of stenosis severity using advanced models to simulate flow through a stenosis Paper II presents a framework to personalize a reduced order mechanistic model of the cardiovascular system using exclusively non invasive measurements including 4D Flow MRI data The modelling approach can unravel a number of clinically relevant parameters from the input data including those representing the contraction and relaxation patterns of the left ventricle and provide estimations of the pressure volume loop In Paper III this framework is applied to study cardiovascular function at rest and during stress conditions and the capability of the model to infer load independent measures of heart function based on the imaging data is demonstrated Paper IV focuses on evaluating the reliability of the model parameters as a step towards translation of the model to the clinic
