Transport Processes And Unit Operations 3rd Edition:

Transport Processes and Unit Operations Christie J. Geankoplis, 1978 This new third edition provides a modern unified treatment of the basic transport processes of momentum heat and mass transfer as well as a broad treatment of the unit operations of chemical engineering Coverage includes the latest membrane separation processes discussion of bioprocesses comprehensive treatment of the transport processes of momentum heat and mass transfer adsorption processes and more A useful up to date reference for practicing chemical engineers agricultural engineers food scientists environmental engineers biochemical engineers and others who work in the process industries

Transport Processes and Unit Operations Christie J. Geankoplis, 1993 Covers completely the fundamental principles and theory of momentum heat and mass transfer and emphasizes their diverse applications in unit operations covers completely the fundamental principles and theory of momentum heat and mass transfer and emphasizes their diverse applications in unit operations features more than 220 example problems includes expanded chapter on membrane separation processes and expanded sections in momentum transfer as well as a new section on adsorption

Transport Processes and Unit Operations Christie J. Geankoplis, 1992

Transport Phenomena Fundamentals Joel L. Plawsky, 2020-02-27 The fourth edition of *Transport Phenomena Fundamentals* continues with its streamlined approach to the subject based on a unified treatment of heat mass and momentum transport using a balance equation approach The new edition includes more worked examples within each chapter and adds confidence building problems at the end of each chapter Some numerical solutions are included in an appendix for students to check their comprehension of key concepts Additional resources online include exercises that can be practiced using a wide range of software programs available for simulating engineering problems such as COMSOL Maple Fluent Aspen Mathematica Python and MATLAB lecture notes and past exams This edition incorporates a wider range of problems to expand the utility of the text beyond chemical engineering The text is divided into two parts which can be used for teaching a two term course Part I covers the balance equation in the context of diffusive transport momentum energy mass and charge Each chapter adds a term to the balance equation highlighting that term's effects on the physical behavior of the system and the underlying mathematical description Chapters familiarize students with modeling and developing mathematical expressions based on the analysis of a control volume the derivation of the governing differential equations and the solution to those equations with appropriate boundary conditions Part II builds on the diffusive transport balance equation by introducing convective transport terms focusing on partial rather than ordinary differential equations The text describes paring down the full microscopic equations governing the phenomena to simplify the models and develop engineering solutions and it introduces macroscopic versions of the balance equations for use where the microscopic approach is either too difficult to solve or would yield much more information than is actually required The text discusses the momentum Bernoulli energy and species continuity equations including a brief description of how these equations are

applied to heat exchangers continuous contactors and chemical reactors The book introduces the three fundamental transport coefficients the friction factor the heat transfer coefficient and the mass transfer coefficient in the context of boundary layer theory Laminar flow situations are treated first followed by a discussion of turbulence The final chapter covers the basics of radiative heat transfer including concepts such as blackbodies graybodies radiation shields and enclosures Transport Processes and Unit Operations Christie G. Geankoplis, Christie J. Geankoplis, 1978

Fundamentals of Food Process Engineering Romeo T. Toledo, 2007-03-06 Written for the upper level undergraduate this updated book is also a solid reference for the graduate food engineering student and professional This edition features the addition of sections on freezing pumps the use of chemical reaction kinetic data for thermal process optimization and vacuum belt drying New sections on accurate temperature measurements microbiological inactivation curves inactivation of microorganisms and enzymes pasteurization and entrainment are included as are non linear curve fitting and processes dependent on fluid film thickness Other sections have been expanded
