Otero-Losada,Francisco G. Wandosell,Luis Miguel Garcia-Segura,Francisco Capani,2019-08-30 Despite compelling preclinical evidence from laboratory models of brain hypoxia suggesting potential neuroprotective strategies only scattered data are available from clinical studies A few candidate neuroprotectants have been studied regarding antioxidant antiapoptotic anti excitotoxic immunomodulatory and neurotrophic effects In parallel with clinical innovations preclinical research initiatives are also identifying new animal models more closely resembling the clinical course and pathology of neurodegenerative diseases Clarifying the specific mission of the brain cells involved in the damage repair system in the examined animal models is important to define new therapeutic targets Following hypoxic damage detrimental events intermingle with the repairing events in both time and cellular dependent fashion Identifying reliable post hypoxia brain markers is mandatory to

develop potential therapeutic interventions improving translational research from the experimental observations to the clinical application A deeper understanding of the precise participation of neurons glia and endothelial cells is expected to offer more clues for designing new therapeutic strategies to reduce the current gap among the experimental and the clinical data One of the main issues should be to study the epigenetic mechanism of neuroprotective agents and their action on the genetic modification induced by hypoxia Achieving this goal is presumed critical to obtain more conclusive results in patients that by now do not receive appropriate therapy for mitigating the several diseases generated by brain hypoxia Although a few ongoing studies are evaluating interesting approaches future research is necessary to come to a novel mechanism of neuroprotection This book encompasses different chapters conveying the goals and aims of the pertaining research
