

MPLS Traffic Engineering

Feature Overview

Multiprotocol Label Switching (MPLS) traffic engineering software enables an MPLS backbone to replicate and expand upon the traffic engineering capabilities of Layer 2 ATM and Frame Relay networks.

Traffic engineering is essential for service provider and Internet service provider (ISP) backbones. Such backbones must support a high use of transmission capacity, and the networks must be very resilient, so that they can withstand link or node failures.

MPLS traffic engineering provides an integrated approach to traffic engineering. With MPLS, traffic engineering capabilities are integrated into Layer 3, which optimizes the routing of IP traffic, given the constraints imposed by backbone capacity and topology.

MPLS traffic engineering:

- Enhances standard IGPs, such as IS-IS or OSPF, to automatically map packets onto the appropriate traffic flows.
- Transports traffic flows across a network using MPLS forwarding.
- Determines the routes for traffic flows across a network based on the resources the traffic flow requires and the resources available in the network.
- Employs "constraint-based routing," in which the path for a traffic flow is the shortest path that meets the resource requirements (constraints) of the traffic flow. In MPLS traffic engineering, the traffic flow has bandwidth requirements, media requirements, a priority versus other flows, and so on.
- Recovers to link or node failures that change the topology of the backbone by adapting to a new set of constraints.

Why Use MPLS Traffic Engineering?

WAN connections are an expensive item in an ISP budget. Traffic engineering enables ISPs to route network traffic to offer the best service to their users in terms of throughput and delay. By making the service provider more efficient, traffic engineering reduces the cost of the network.

Currently, some ISPs base their services on an overlay model. In the overlay model, transmission facilities are managed by Layer 2 switching. The routers see only a fully meshed virtual topology, making most destinations appear one hop away. If you use the explicit Layer 2 transit layer, you can precisely control the ways in which traffic uses available bandwidth. However, the overlay model

Traffic Engineering with MPLS Eric D. Osborne, Ajay Simha, 2002 Design configure and manage MPLS TE to optimize network performance Almost every busy network backbone has some congested links while others remain underutilized That s because shortest path routing protocols send traffic down the path that is shortest without considering other network parameters such as utilization and traffic demands Using Traffic Engineering TE network operators can redistribute packet flows to attain more uniform distribution across all links Forcing traffic onto specific pathways allows you to get the most out of your existing network capacity while making it easier to deliver consistent service levels to customers at the same time Cisco r Multiprotocol Label Switching MPLS lends efficiency to very large networks and is the most effective way to implement TE MPLS TE routes traffic flows across the network by aligning resources required by a given flow with actual backbone capacity and topology This constraint based routing approach feeds the network route traffic down one or more pathways preventing unexpected congestion and enabling recovery from link or node failures Traffic Engineering with MPLS provides you with information on how to use MPLS TE and associated features to maximize network bandwidth This book focuses on real world applications from design scenarios to feature configurations to tools that can be used in managing and troubleshooting MPLS TE Assuming some familiarity with basic label operations this guide focuses mainly on the operational aspects of MPLS TE how the various pieces work and how to configure and troubleshoot them Additionally this book addresses design and scalability issues along with extensive deployment tips to help you roll out MPLS TE on your own network Understand the background of TE and MPLS and brush up on MPLS forwarding basics Learn about router information distribution and how to bring up MPLS TE tunnels in a network Understand MPLS TE s Constrained Shortest Path First CSPF and mechanisms you can use to influence CSPF s path calculation Use the Resource Reservation Protocol RSVP to implement Label Switched Path setup Use various mechanisms to forward traffic down a tunnel Integrate MPLS into the IP quality of service QoS spectrum of services Utilize Fast Reroute FRR to mitigate packet loss associated with link and node failures Understand Simple Network Management Protocol SNMP based measurement and accounting services that are available for MPLS Evaluate design scenarios for scalable MPLS TE deployments Manage MPLS TE networks by examining common configuration mistakes and utilizing tools for troubleshooting MPLS TE problems Eric and Ajay work in the development group at Cisco that built Traffic Engineering They are among those with the greatest hands on experience with this application This book is the product of their experience George Swallow Cisco Systems Architect for Traffic Engineering Co Chair IETF MPLS Working Group Eric Osborne CCIE r 4122 has been doing Internet engineering of one sort or another since 1995 He joined Cisco in 1998 to work in the Cisco Technical Assistance Center TAC moved from there to the ISP Expert team and then to the MPLS Deployment team He has been involved in MPLS since the Cisco IOS r Software Release 11 1CT days Ajay Simha CCIE 2970 joined the Cisco TAC in 1996 He then went on to support tier 1 and 2 ISPs as part of Cisco s ISP
