Cryptosporidium as a Foodborne Pathogen Lucy J. Robertson,2013-11-19 Although widely recognized as an important waterborne pathogen *Cryptosporidium* spp can also be transmitted by contamination of food The same properties of this protozoan parasite that mean that water is an excellent transmission vehicle are also important for foodborne transmission These include the low infective dose the high number of oocysts that are excreted and the robustness of these transmission stages However many more outbreaks of waterborne cryptosporidiosis have been reported than foodborne outbreaks This is probably partly due to epidemiological tracing being much more difficult for foodborne outbreaks than waterborne outbreaks and the number of persons exposed to infection often being fewer Nevertheless the potential importance of foodborne transmission is gradually being recognized and a wide range of different foodstuffs have been associated with those outbreaks that have been recorded Additionally various factors mean that the potential for foodborne transmission is becoming of increasing importance these include the growth of international food trade a current trend for eating raw or very lightly cooked foods and the rise in small scale organic farms where there the possibility for contamination of vegetable crops with animal feces may be greater

Conference Research Topic: 9th Symposium on Antimicrobial Resistance in Animals and the Environment (ARAE 2023) Benoit Doublet, Michel Stanislas Zygmunt, Axel

Cloeckaert, Sebastien Olivier Leclercq, 2025-02-03 The emergence of antimicrobial resistance is a seminal public health concern Significant progress has been made in recent years regarding an understanding of the genetic and biochemical basis for antimicrobial resistance the emergence of resistance genes and factors promoting their widespread dissemination including the role of lateral gene transfer Nevertheless there is a dearth of information regarding the key hotspots and genetic mechanisms responsible for resistance development and the exposure routes leading to the failure of antimicrobial agents important in human and animal medicine There is thus an urgent need for research to provide

governments public health stakeholders and the agricultural sector the knowledge required to develop policies and practices that effectively mitigate resistance development This within a growing recognition that humans animals and the environment must be considered as intimately linked together if any resistance management strategy is to be successful **Pathogen**
