

EXERCISES PROBLEMS

Entropy is the degree of randomness or disorder. This implies that change in entropy in ΔS (which can vary either way) has two settings. Molecules with more disorder have more entropy. Increased disorder means atoms move freely, and gases have an even larger amount of entropy. According to the formulation of the second law, entropy always increases for a process at constant pressure.

Entropy increases whenever the following reactions occur and decrease in situations in which the opposite is true.

EXERCISES PROBLEMS

The equation for Gibbs Free Energy is $\Delta G = \Delta H - T\Delta S$.

Just as reactions in the spontaneous, the sign for ΔG has to be negative. ΔH represents the heat of reaction. ΔS is the change in entropy. T is temperature in Kelvin.

A negative value for ΔG means that the reaction is spontaneous. This means that heat is released.

A positive value for ΔG means that the reaction is nonspontaneous. This means that heat is absorbed.

A negative value for ΔS means that the products are more ordered than the reactants.

A positive value for ΔS means that the products are less ordered than the reactants.
