Hybrid Nature Daniel Schneider,2011 A history of of the industrial ecosystem that focuses on the biological sewage treatment plant as an early example Biological sewage treatment like electricity power generation telephones and mass transit has been a key technology and a major part of the urban infrastructure since the late nineteenth century But sewage treatment plants are not only a ubiquitous component of the modern city they are also ecosystems a hybrid variety that incorporates elements of both nature and industry and embodies multiple contradictions In Hybrid Nature Daniel Schneider offers an environmental history of the biological sewage treatment plant in the United States and England viewing it as an early and influential example of an industrial ecosystem The sewage treatment plant relies on microorganisms and other plants and animals but differs from a natural ecosystem in the extent of human intervention in its creation and management Schneider explores the relationship between society and nature in the industrial ecosystem and the contradictions that define it the naturalization of industry versus the industrialization of nature the public interest versus private patented technology engineers versus bacterial and human labor and purification versus profits in the marketing of sewage fertilizer Schneider also describes biotechnology s direct connections to the history of sewage treatment and how genetic engineering is extending the reaches of the industrial ecosystem to such natural ecosystems as oceans rivers and forests In a conclusion that shows how industrial ecosystems continue to evolve Schneider discusses John Todd s Living Machine a natural purification method of sewage treatment as the embodiment of the contradictions of the industrial ecosystem

[Benchmarking of Control Strategies for Wastewater Treatment Plants](#) Krist V. Gernaey, Ulf Jeppsson, Peter A. Vanrolleghem, John B. Copp, 2014-09-15 Wastewater treatment plants are large non linear systems subject to large perturbations in wastewater flow rate load and composition Nevertheless these plants have to be operated continuously meeting stricter and stricter regulations Many control strategies have been proposed in the literature for improved and more efficient operation of wastewater treatment plants Unfortunately their evaluation and comparison

either practical or based on simulation is difficult. This is partly due to the variability of the influent to the complexity of the biological and biochemical phenomena and to the large range of time constants from a few minutes to several days. The lack of standard evaluation criteria is also a tremendous disadvantage. To really enhance the acceptance of innovative control strategies such an evaluation needs to be based on a rigorous methodology including a simulation model, plant layout, controllers, sensors, performance criteria and test procedures, i.e. a complete benchmarking protocol. This book is a Scientific and Technical Report produced by the IWA Task Group on Benchmarking of Control Strategies for Wastewater Treatment Plants. The goal of the Task Group includes developing models and simulation tools that encompass the most typical unit processes within a wastewater treatment system: primary treatment, activated sludge, sludge treatment, etc., as well as tools that will enable the evaluation of long term control strategies and monitoring tasks, i.e. automatic detection of sensor and process faults. Work on these extensions has been carried out by the Task Group during the past five years and the main results are summarized in *Benchmarking of Control Strategies for Wastewater Treatment Plants*. Besides a description of the final version of the already well known Benchmark Simulation Model no. 1 (BSM1), the book includes the Benchmark Simulation Model no. 1 Long Term (BSM1_LT) with focus on benchmarking of process monitoring tasks and the plant wide Benchmark Simulation Model no. 2 (BSM2).

Guidelines for Using Activated Sludge Models Leiv Rieger, Sylvie Gillot, Guenter Langergraber, Takayuki Ohtsuki, Andrew Shaw, Imre Takacs, Stefan Winkler, 2012-09-14 Mathematical modelling of activated sludge systems is used widely for plant design optimisation training controller design and research The quality of simulation studies varies depending on the project objectives finances and expertise available Consideration has to be given to the model accuracy and the amount of time required carrying out a simulation study to produce the desired accuracy Inconsistent approaches and insufficient documentation make quality assessment and comparison of simulation results difficult or almost impossible A general framework for the application of activated sludge models is needed in order to overcome these obstacles The genesis of the Good Modelling Practice GMP Task Group lies in a workshop held at the 4th IWA World Water Congress in Marrakech Morocco where members of research groups active in wastewater treatment modelling came together to develop plans to synthesize the best practices of modellers from all over the world The most cited protocols were included in the work amongst others from HSG Hochschulgruppe STOWA BIOMATH and WERF The goal of the group is to set up an internationally accepted framework to deal with the ASM type models in practice This framework shall make modelling more straightforward and systematic to use especially for practitioners and consultants Additionally it shall help to define quality levels for simulation results a procedure to assess this quality and to assist in the proper use of the models The framework will describe a methodology for goal oriented application of activated sludge models demonstrated by means of a concise guideline about the procedure of a simulation study and some illustrative case studies The case studies shall give examples for the required data quality and quantity and the effort for calibration validation with respect to a defined goal The final report will include an extended appendix with additional information and details of methodologies Additional features in Guidelines for Using Activated Sludge Models include a chapter on modelling industrial wastewater an overview on the history current practice and future of activated sludge modelling and several explanatory case studies It can be used as an introductory book to learn about Good Modelling Practice GMP in activated sludge modelling and will be of special interest for process engineers who have no prior knowledge of modelling or for lecturers who need a textbook for their students The STR can also be used as a modelling reference book and includes an extended appendix with additional information and details of methodologies Scientific and Technical Report No 22
