High-Energy-Density Physics R Paul Drake,2018-01-02 The raw numbers of high energy density physics are amazing shock waves at hundreds of km s approaching a million km per hour temperatures of millions of degrees and pressures that exceed 100 million atmospheres This title surveys the production of high energy density conditions the fundamental plasma and hydrodynamic models that can describe them and the problem of scaling from the laboratory to the cosmos Connections to astrophysics are discussed throughout The book is intended to support coursework in high energy density physics to meet the needs of new researchers in this field and also to serve as a useful reference on the fundamentals Specifically the book has been designed to enable academics in physics astrophysics applied physics and engineering departments to provide in a single course an introduction to fluid mechanics and radiative transfer with dramatic applications in the field of high energy density systems This second edition includes pedagogic improvements to the presentation throughout and additional material on equations of state heat waves and ionization fronts as well as problem sets accompanied by solutions

Laser-Matter Interaction for Radiation and Energy Hitendra K. Malik,2021-03-14 The interaction of high power lasers with matter can generate Terahertz radiations that efficiently contribute to THz Time Domain Spectroscopy and also would replace X rays in medical and security applications When a short intense laser pulse ionizes a gas it may produce new frequencies even in VUV to XUV domain The duration of XUV pulses can be confined down to the isolated attosecond pulse levels required to study the electronic re arrangement and ultrafast processes Another important aspect of laser matter interaction is the laser thermonuclear fusion control where accelerated particles also find an efficient use This book provides comprehensive coverage of the most essential topics including Electromagnetic waves and lasers THz radiation using semiconducting materials nanostructures gases plasmas Surface plasmon resonance THz radiation detection Particle acceleration technologies X ray lasers High harmonics and attosecond lasers Laser based techniques of thermonuclear fusion Controlled fusion devices including NIF and ITER The book comprises of 11 chapters and every chapter starts with a lucid introduction to the main topic Then sub topics are sedulously discussed keeping in mind their basics methodology state of the art and future perspective that will prove to be salutary for readers High quality solved examples are appended to the chapters for their deep understanding and relevant applications In view of the nature of the topics and their level of discussion this book is expected to have pre eminent potential for researchers along with postgraduate and undergraduate students all over the world
