Large-Scale PDE-Constrained Optimization in Applications Subhendu Bikash Hazra,2009-12-16 With continuous development of modern computing hardware and applicable numerical methods computational fluid dynamics CFD has reached certain level of maturity so that it is being used routinely by scientists and engineers for fluid flow analysis Since most of the real life applications involve some kind of optimization it has been natural to extend the use of CFD tools from fluid flow simulation to simulation based optimization However the transition from simulation to optimization is not straight forward it requires proper interaction between advanced CFD methodologies and state of the art optimization algorithms The ultimate goal is to achieve optimal solution at the cost of few fluid flow solutions There is growing number of search activities to achieve this goal This book results from my work done on simulation based optimization problems at the Department of Mathematics University of Trier and reported in my postdoctoral thesis Habilitationsschrift accepted by the Faculty IV of this University in 2008 The focus of the work has been to develop mathematical methods and algorithms which lead to efficient and high performance computational techniques to solve such optimization problems in real life applications Systematic development of the methods and algorithms are presented here Practical aspects of implementations are discussed at each level as the complexity of the problems increase supporting with enough number of computational examples **A Direct Method for Parabolic PDE Constrained Optimization Problems** Andreas Potschka,2013-11-29 Andreas Potschka discusses a direct multiple shooting method for dynamic optimization problems constrained by nonlinear possibly time periodic parabolic partial differential equations In contrast to indirect methods this approach automatically computes adjoint derivatives without requiring the user to formulate adjoint equations which can be time consuming and error prone The author describes and analyzes in detail a globalized inexact Sequential Quadratic Programming method that exploits the mathematical structures of this approach and problem class for fast numerical performance The book features applications including results for a real world chemical engineering separation problem **Optimization with PDE Constraints** Michael Hinze,Rene Pinnau,Michael Ulbrich,Stefan Ulbrich,2008-10-16 Solving optimization problems subject to constraints given in terms of

partial differential equations PDEs with additional constraints on the controls and or states is one of the most challenging problems in the context of industrial medical and economical applications where the transition from model based numerical simulations to model based design and optimal control is crucial For the treatment of such optimization problems the interaction of optimization techniques and numerical simulation plays a central role After proper discretization the number of optimization variables varies between 10 and 10 It is only very recently that the enormous advances in computing power have made it possible to attack problems of this size However in order to accomplish this task it is crucial to utilize and further explore the specific mathematical structure of optimization problems with PDE constraints and to develop new mathematical approaches concerning mathematical analysis structure exploiting algorithms and discretization with a special focus on prototype applications The present book provides a modern introduction to the rapidly developing mathematical field of optimization with PDE constraints The first chapter introduces to the analytical background and optimality theory for optimization problems with PDEs Optimization problems with PDE constraints are posed in infinite dimensional spaces Therefore functional analytic techniques function space theory as well as existence and uniqueness results for the underlying PDE are essential to study the existence of optimal solutions and to derive optimality conditions
