Noebe, Phillip B. Abel, 2007-12-19 While it is tempting to label computational materials modeling as an emerging field of research the truth is that both in nature and foundation it is just as much an established field as the concepts and techniques that define it It is the recent enormous growth in computing power and communications that has brought the activity to the fore front turning it into a possible component of any modern materials research program Together with its increased role and visibility there is also a dynamic change in the way computational modeling is perceived in such a vast field as materials science with its wide range of length and time scales As the pace of materials research accelerates and the need for often inaccessible information continues to grow the demands

and expectations on existing modeling techniques have progressed that much faster Primarily because there is no one technique that can provide all the answers at every length and time scale in materials science excessive expectations of computational materials modeling should be avoided if possible While it is apparent that computational modeling is the most efficient method for dealing with complex systems it should not be seen as an alternative to traditional experimentation Instead there is another option which is perhaps the one that is most likely to become the defining characteristic of computational materials modeling
